# Heat Map

Heat Map

- 색을 통해 특정 metrics aggregation 결과 시각화
- bucket은 (Chart 당) 최대 2개 생성 가능 (x축, y축)
- 주로 Categorical Field Data에 적용

## Heat Map Object

해석

- nginx-\* index의
- "@timestamp" field 기준 “**2018-06-01 ~ 2018-08-12**” documents의
- “**nginx.access.body\_sent.bytes**” field 값의 평균이 가장 큰
- “**nginx.access.geoip.city\_name**” field 5개 별
- “**nginx.access.body\_sent.bytes**” field로 아래와 같이 bucket을 생성한 후
  - 0 ~ 300
  - 300 ~ 600
  - 600 ~ 900
  - 900 ~
- “**nginx.access.remote\_ip**” field의 unique 개수

(x축) 도시별

(y축) 데이터 크기별

unique한 ip 주소 개수

## Heat Map Configuration 1

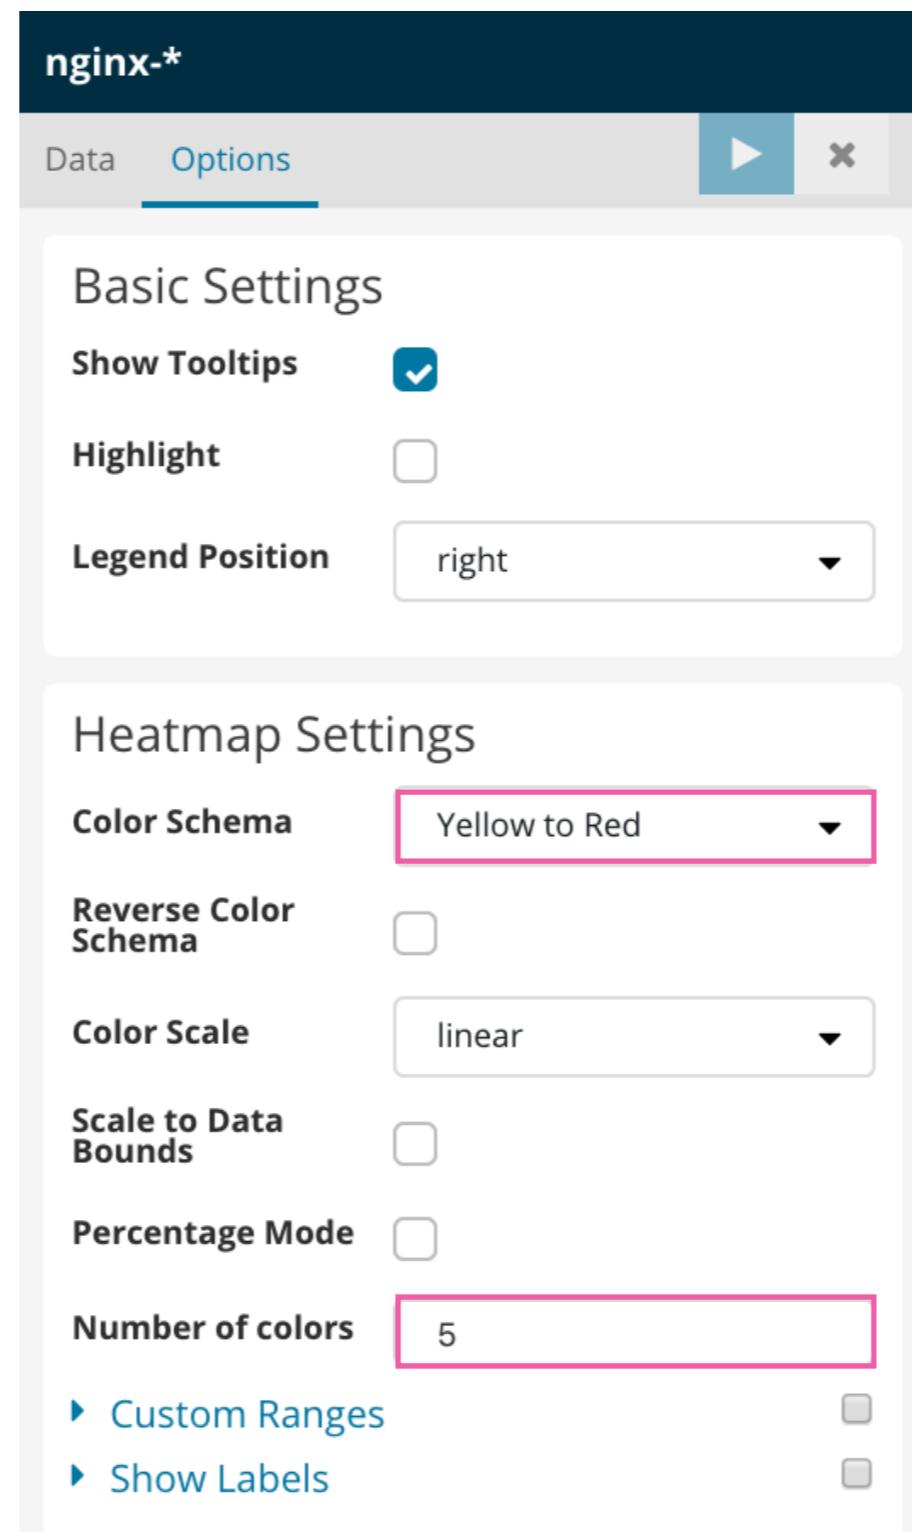

The screenshot shows the Grafana interface for configuring a Heat Map visualization named "nginx-\*". The "Data" tab is selected. The configuration steps are outlined as follows:

- ① Unique Count aggregation 선택
- ② Unique Count aggregation 적용할 Field 선택
- ③ Terms aggregation 선택
- ④ Terms aggregation 후 bucket 선정 기준 선택
- ⑤ Custom Metric 선택
- ⑥ Custom Metric 적용할 Field 선택
- ⑦ 정렬방식 (오름/내림) 선택
- ⑧ 반영할 bucket 개수 입력
- ⑨ Range aggregation 선택
- ⑩ Range aggregation 적용할 Field 선택
- ⑪ bucket 별 Range 직접 입력

Detailed description of the configuration fields:

- Metrics**: Value (Selected)
- Aggregation**: Unique Count (Selected)
- Field**: nginx.access.remote\_ip
- Buckets**: X-Axis
  - Aggregation**: Terms (Selected)
  - Field**: nginx.access.geoip.city\_name
- Order By**: Custom Metric
- Aggregation**: Average (Selected)
- Field**: nginx.access.body\_sent.bytes
- Order**: Descending
- Size**: 5
- Group other values in separate bucket
- Show missing values
- Y-Axis**: Range
- Field**: nginx.access.body\_sent.bytes
- From**: 0, 300, 600, 900
- To**: 300, 600, 900

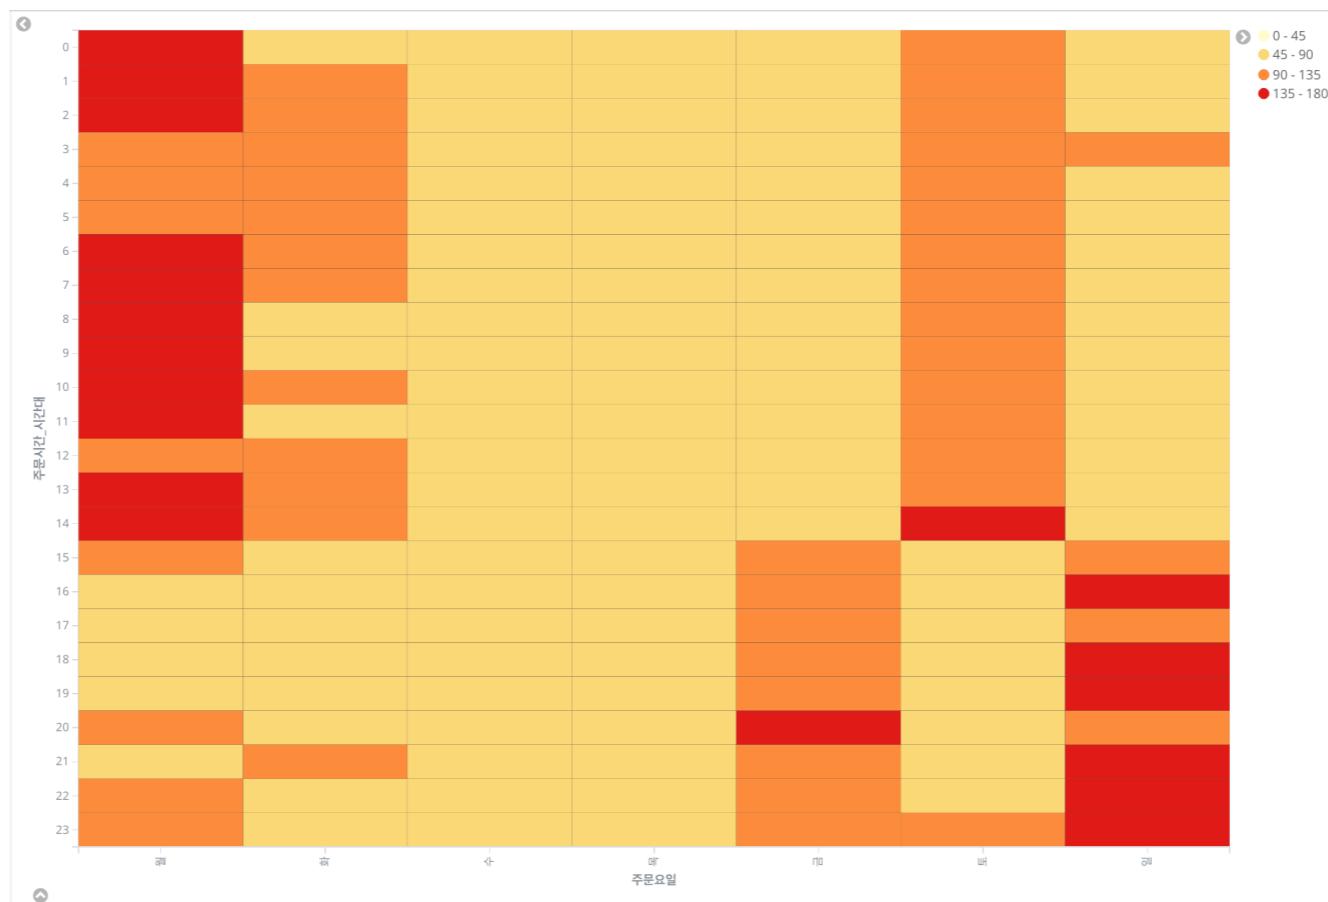

## Heat Map Configuration 2

⑬ 적절한 Color Schema 선택

⑭ 사용할 Color 개수 입력 (세분화)

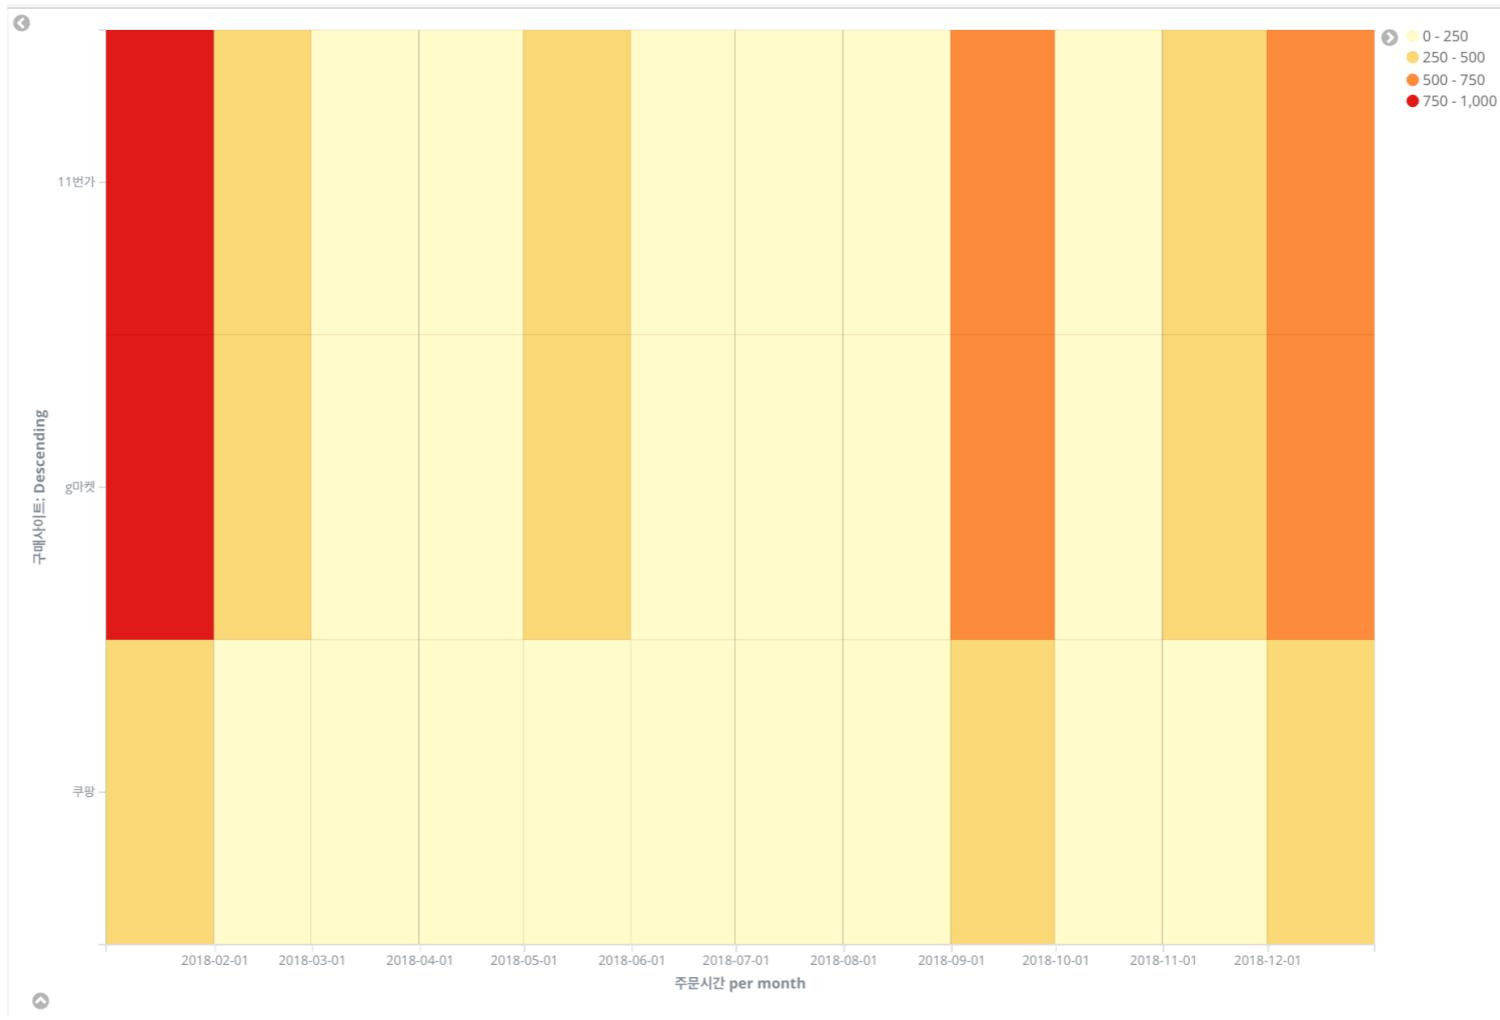

## 예제 8) Heat Map

조건

- shopping index 중에서
  - “주문시간” field 기준 this year documents를
  - “주문시간\_요일\_sort“ field 값의 평균이 큰 7개의 “주문시간\_요일” field 별
  - 1 단위로 나눈 “주문시간\_시간대” field 별
  - document 개수
- (x축) 일별  
— (y축) 시간대별  
— 판매수

## 예제 9) Heat Map

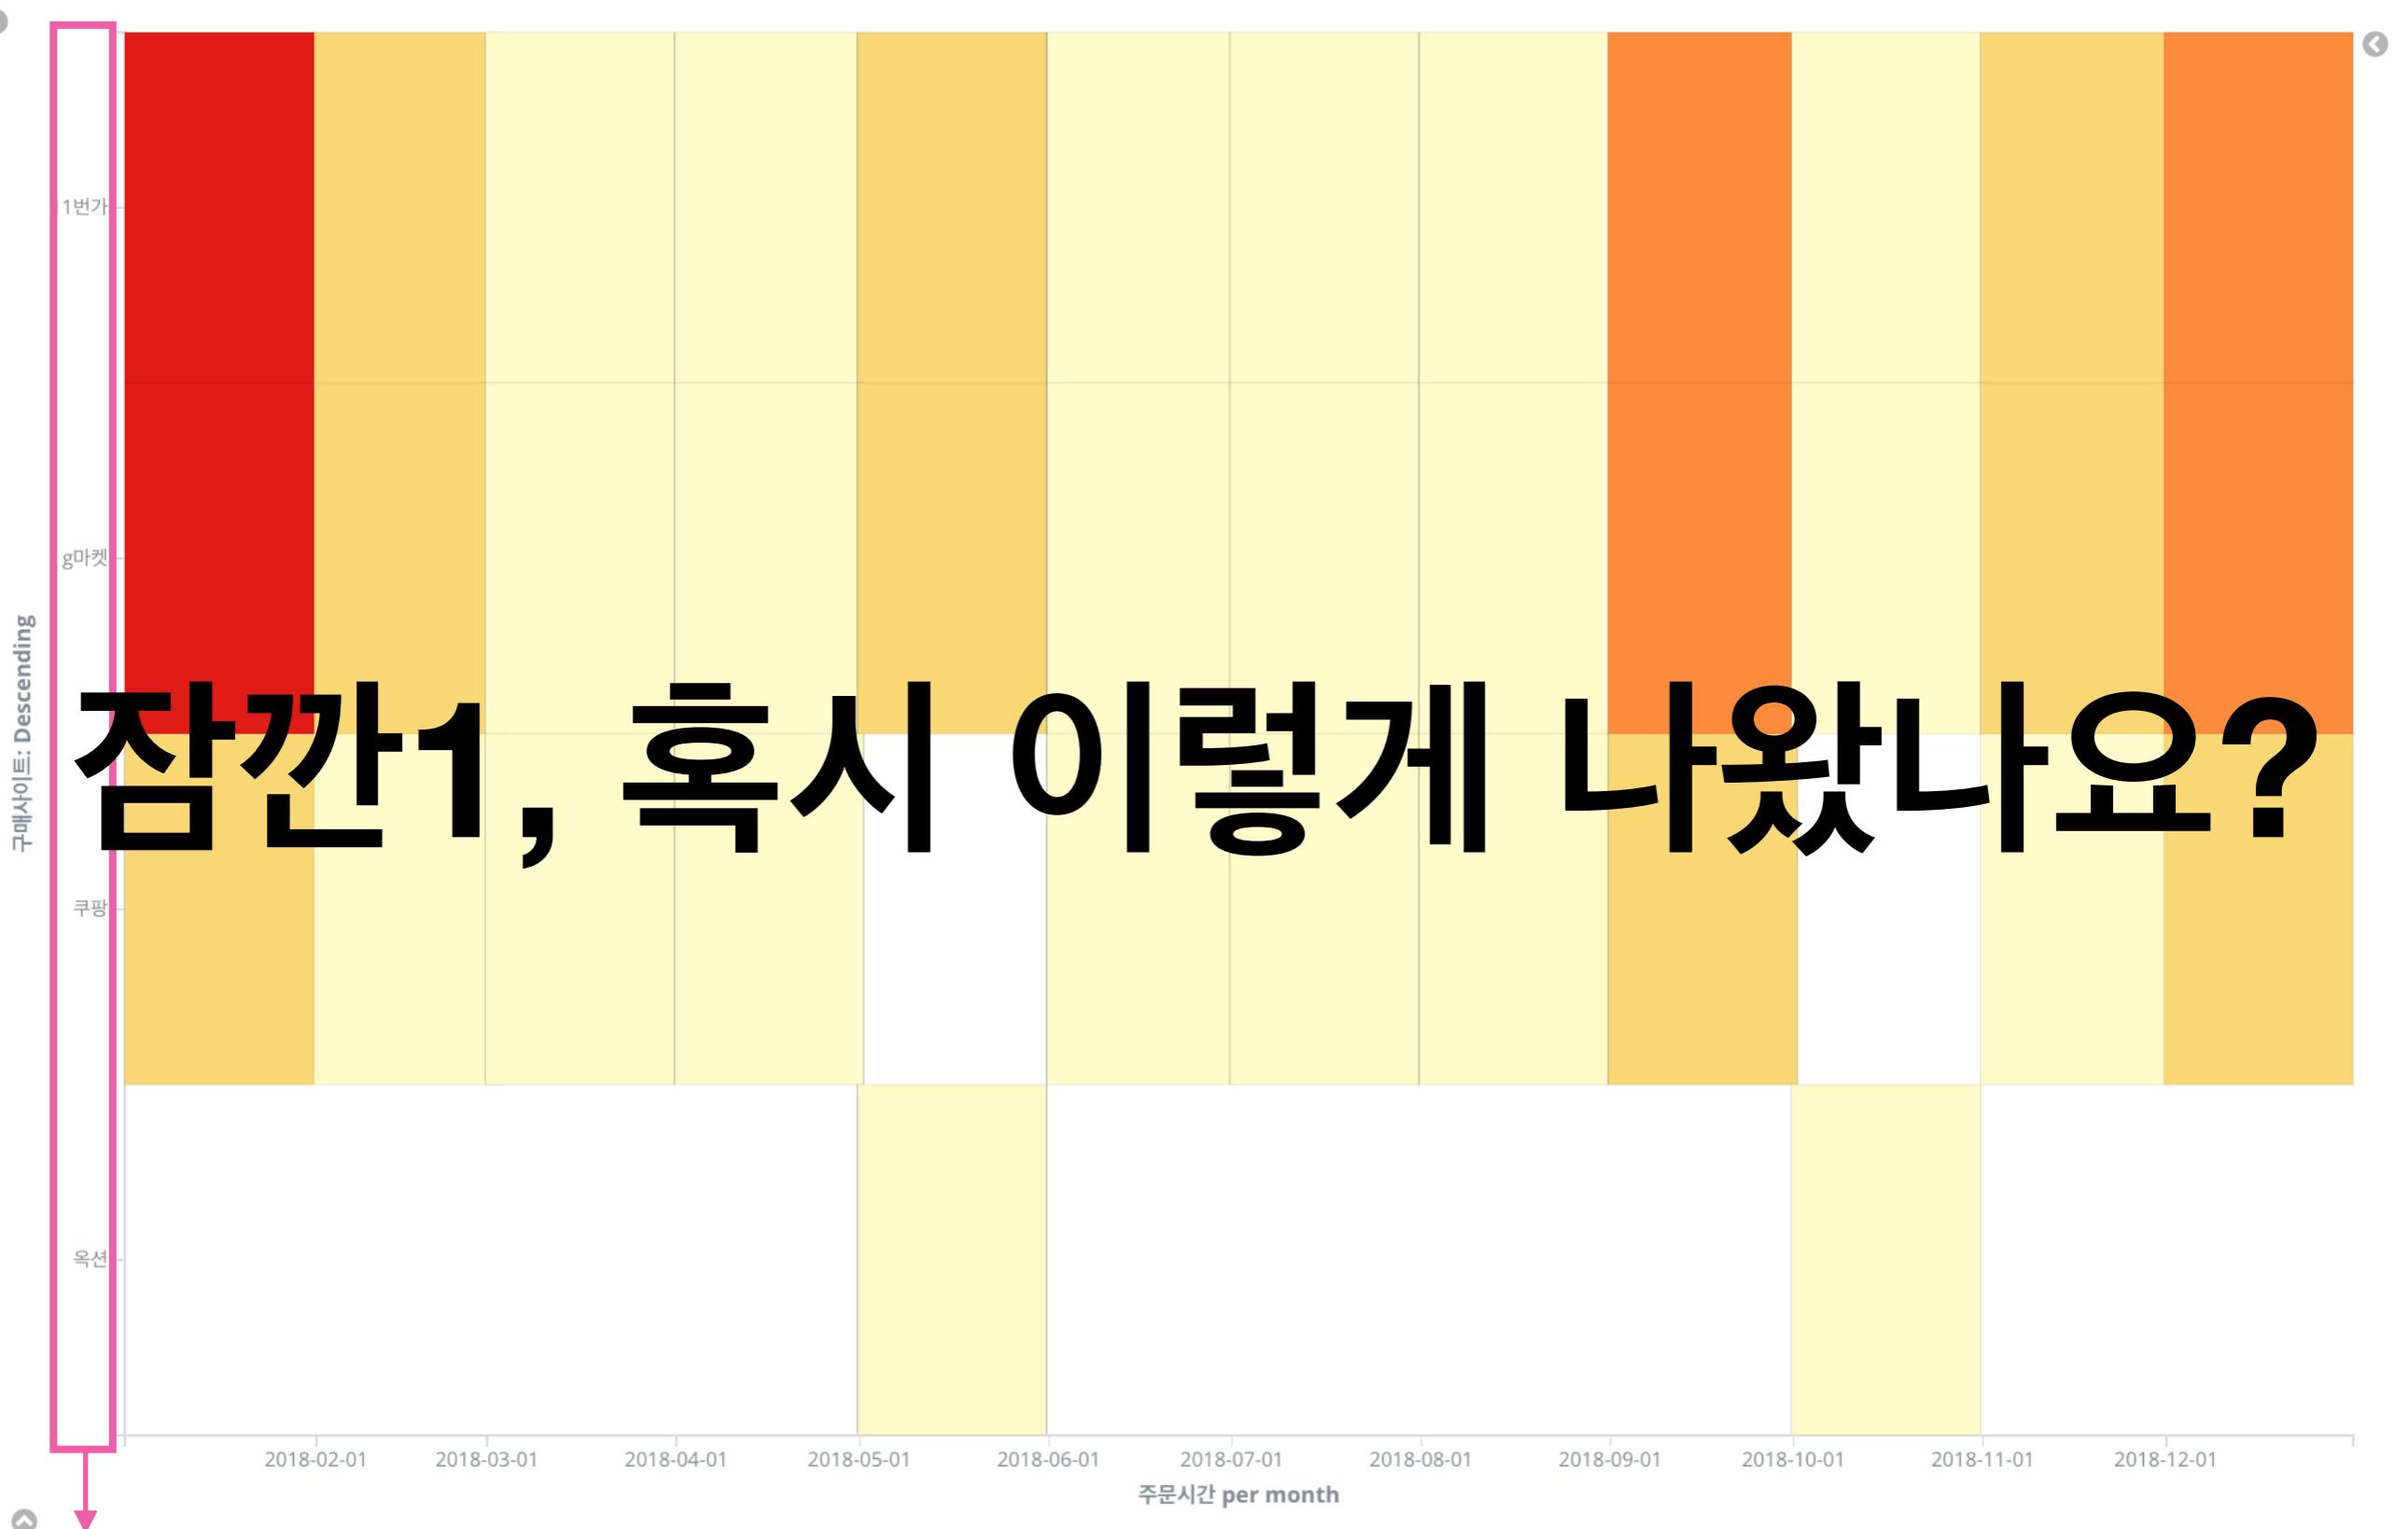

조건

- shopping index 중에서
- “주문시간” field 기준 this year documents를
- documents 개수가 가장 많았던 3개의 “구매사이트” field 별로
- “주문시간” field를 기준으로 월별(monthly) bucket을 생성한 후
- documents 개수

— (y축) 구매사이트 별

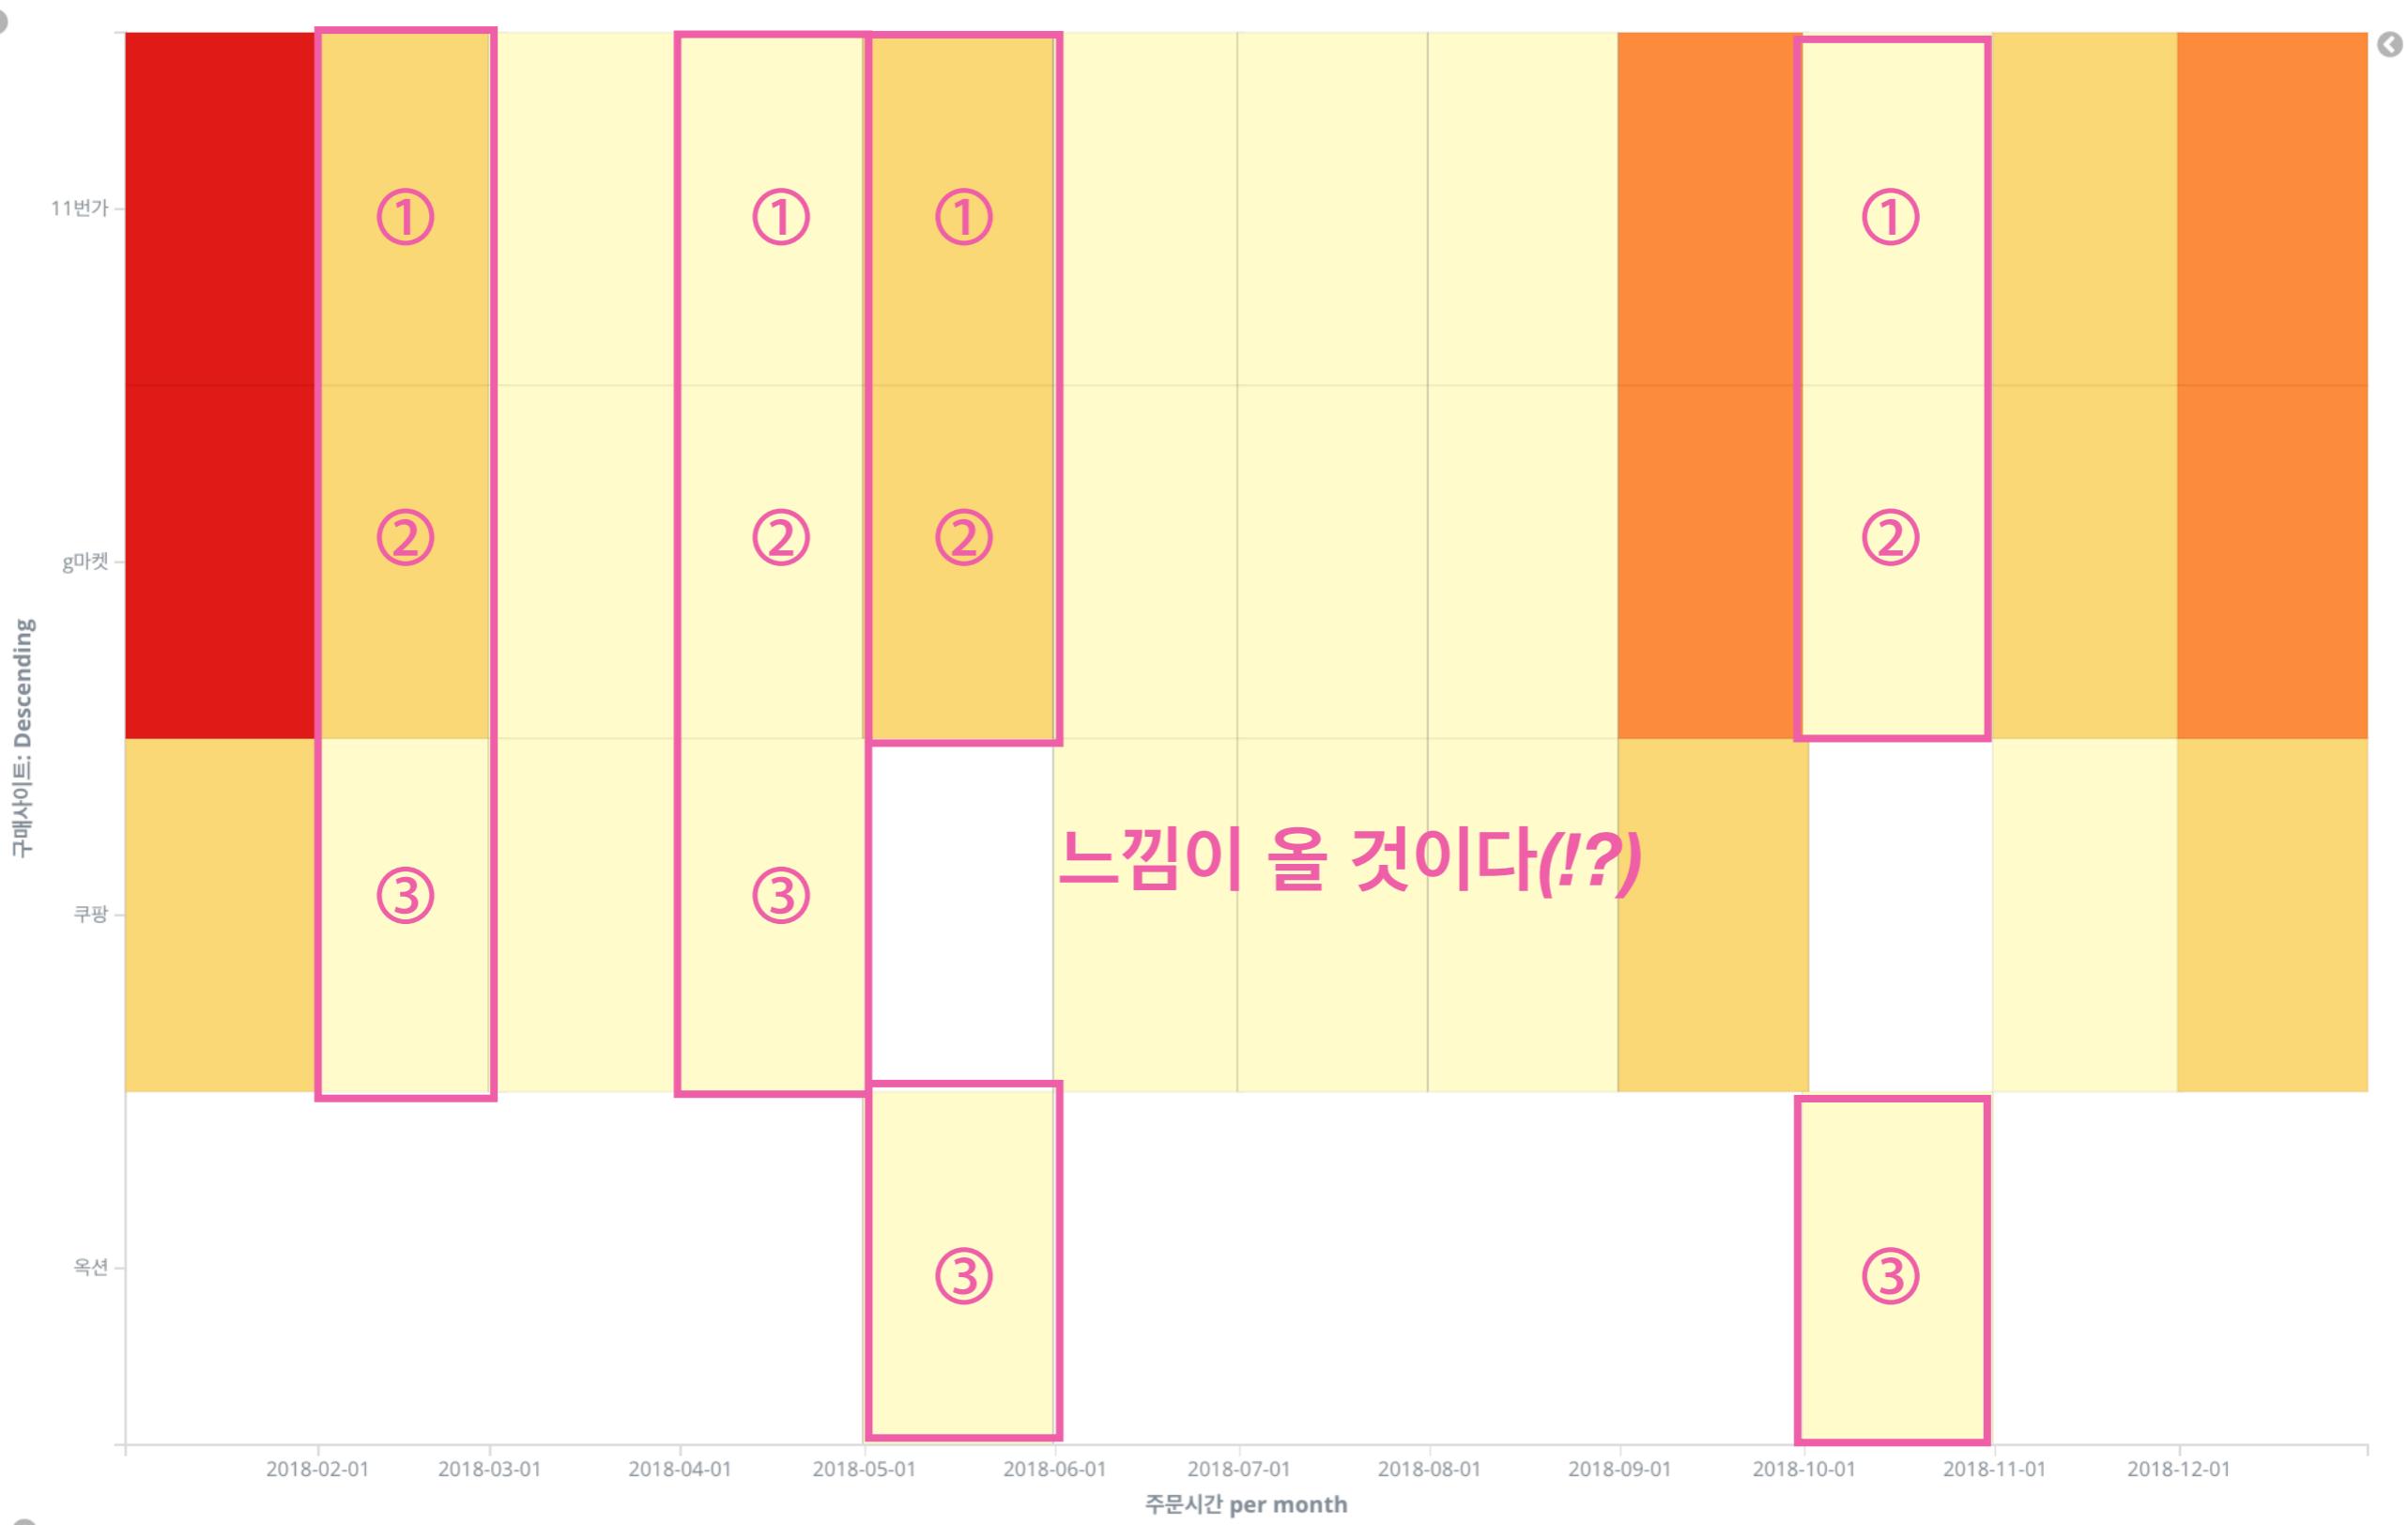

— (x축) 월별

— 판매수

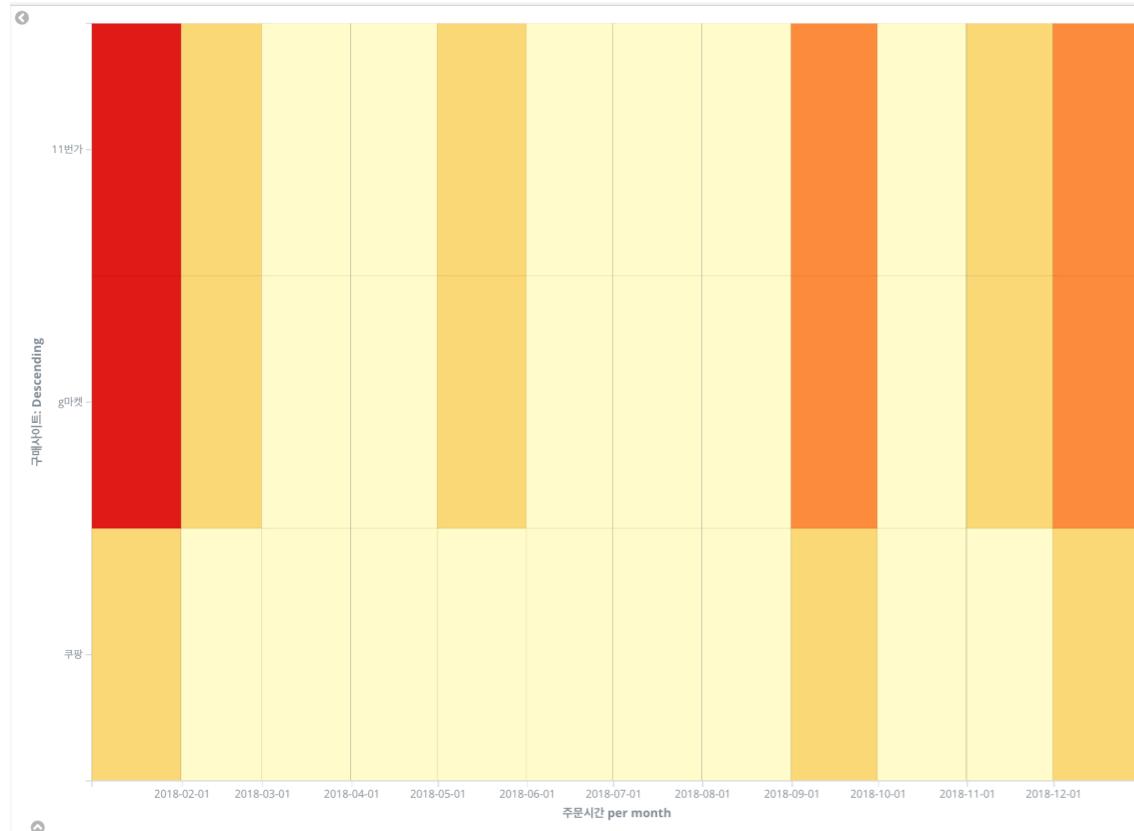

왜 4개가 나올까?

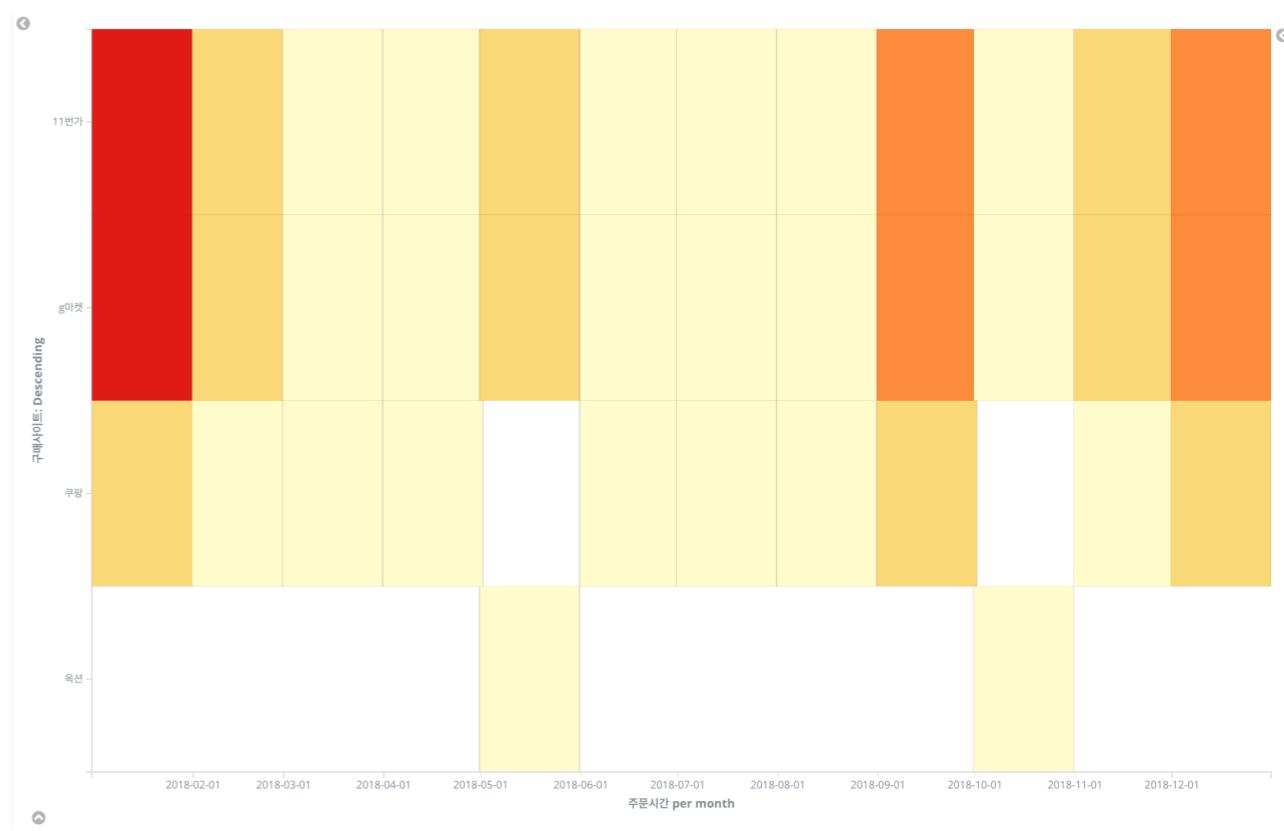

## 예제9) 힌트

## Bucket Aggregation 순서 주의

VS

documents 개수가 많았던 구매사이트 3개에 대해서 월별로....

월별로 documents 개수가 많았던 구매사이트 3개에 대해서...

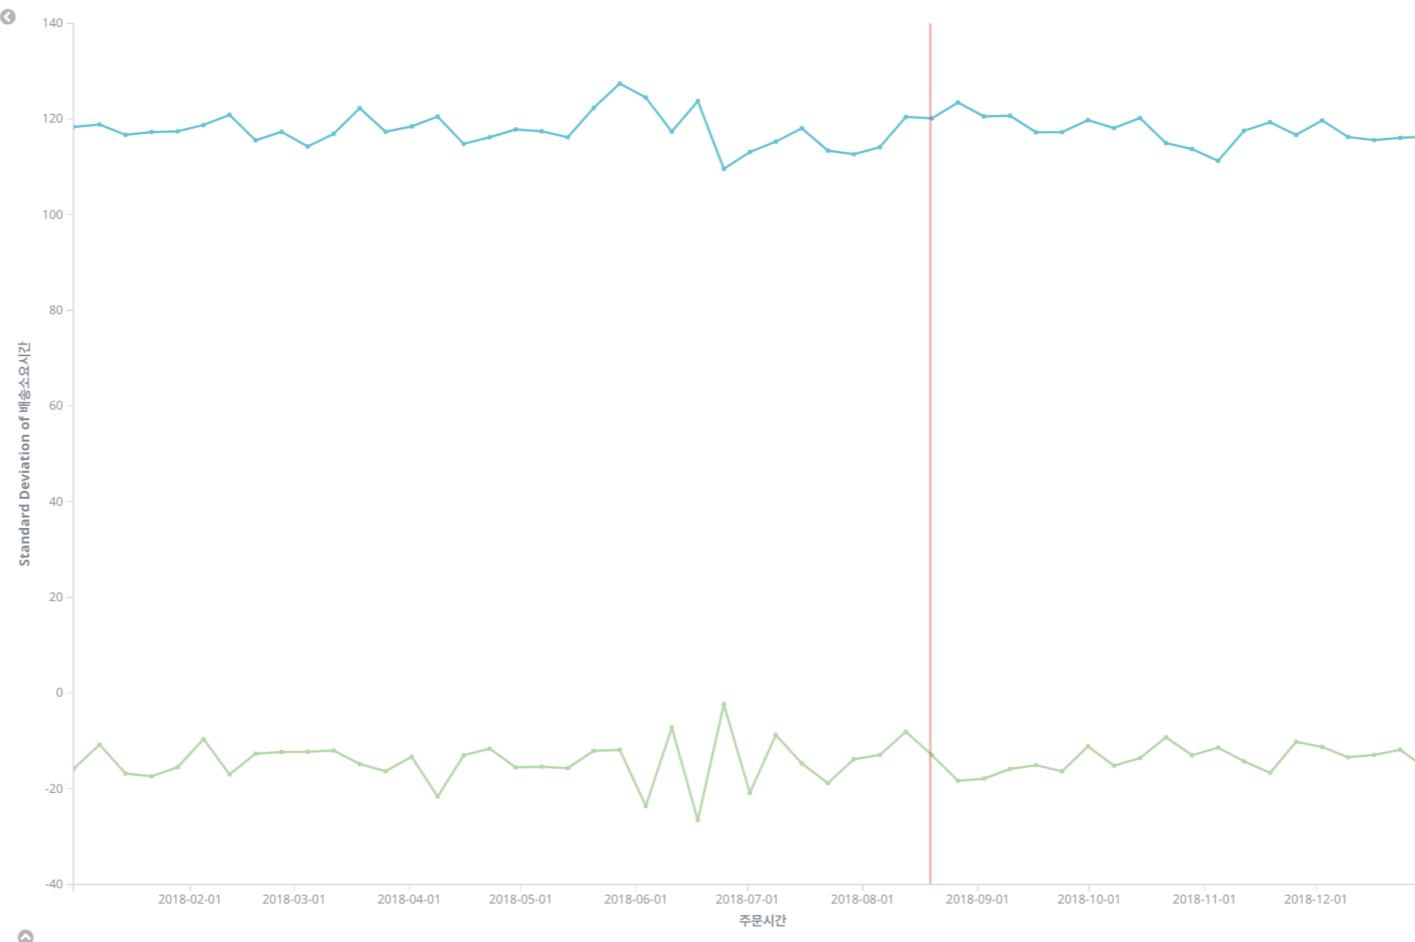

## Line Chart

Line

- x축의 변화에 따른 특정 field의 값의 추이를 볼 때 사용
- 주로 x축은 날짜/시간 관련 field를 사용
- kibana 설정은 line // bar // area 모두 유사

## Line Chart Object

해석

- shopping index의
- “주문시간” field 기준 this year documents의
- “주문시간” field를 기준으로 주별(weekly) bucket을 생성한 후      ━━      주별
- “배송소요시간” field의 표준편차      ━━      배송소요시간의 표준편차

## Line Chart Configuration 1

The screenshot shows the configuration interface for a 'Line Chart Configuration 1' in the 'shopping' panel. The interface is divided into two main sections: 'Metrics' and 'Buckets'.

**Metrics Section:**

- ⑥ Panel Settings 선택**: The 'Panel Settings' tab is selected.
- ① Standard Deviation Aggregation 선택**: The 'Metrics' dropdown is set to 'Standard Deviation'.
- ② Standard Deviation Aggregation 적용할 Field 선택**: The 'Field' dropdown is set to '배송소요시간'.
- Custom Label**: An empty input field for custom labels.
- Add metrics**: A button to add more metrics.

**Buckets Section:**

- ⑤ Date Histogram 간격 설정**: The 'X-Axis' dropdown is set to 'Date Histogram'.
- ③ Date Histogram Aggregation 선택**: The 'Field' dropdown is set to '주문시간'.
- ④ Date Histogram Aggregation 적용할 Field 선택**: The 'Interval' dropdown is set to 'Weekly'.
- Custom Label**: An empty input field for custom labels.
- Add sub-buckets**: A button to add more sub-buckets.

# 잠깐2, 왜 표준편차 값이 2개지?

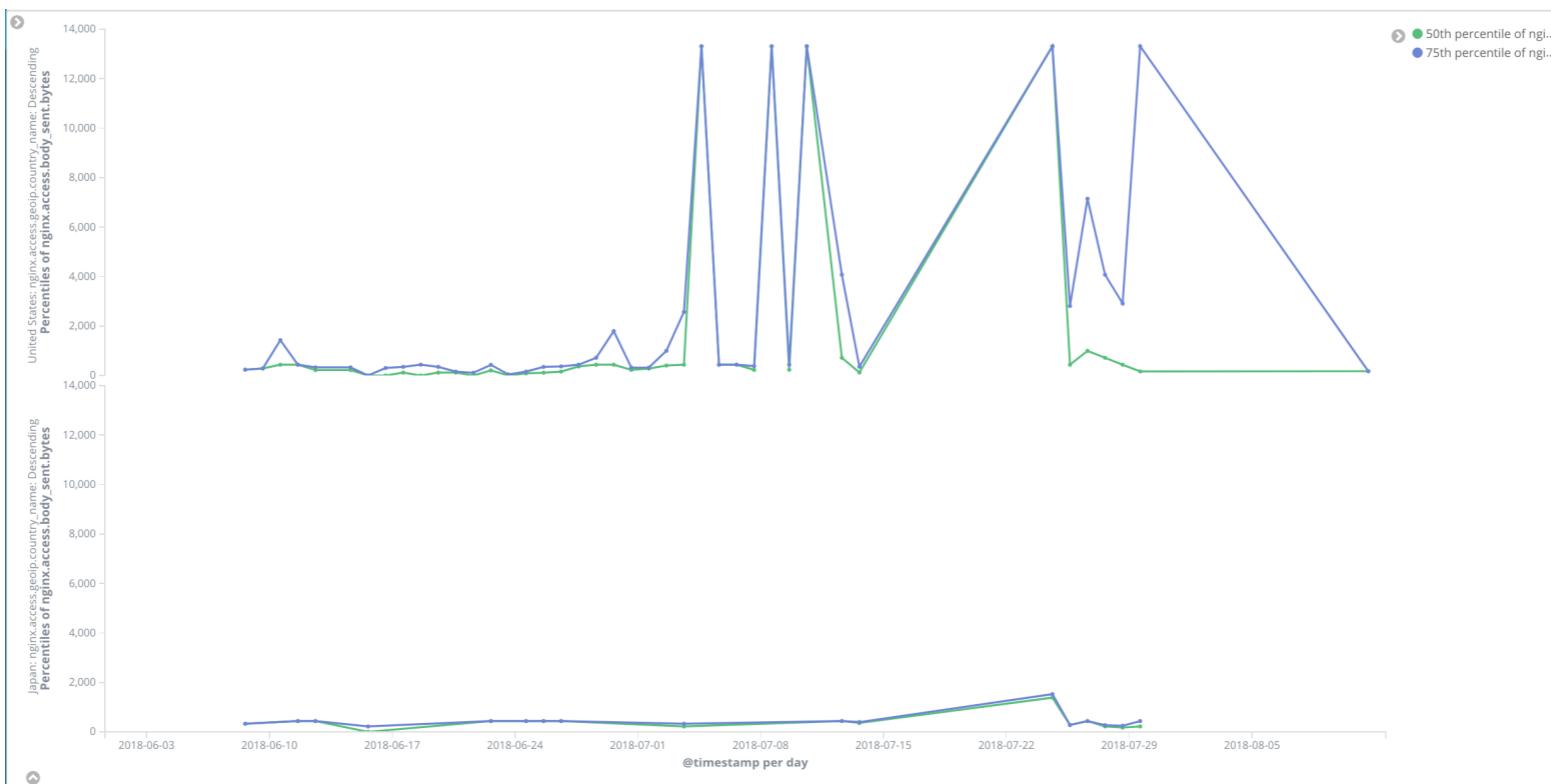

## 2SD Rule (2표준편차 법칙)

심화

- 정규분포에서 약 95%의 값들이 평균에서 양쪽으로 2 표준편차 범위( $\mu\pm 2\sigma$ )에 존재한다
- Kibana에서는  $\mu+2\sigma$  값과  $\mu-2\sigma$  값을 보여준 것이다 (변경 가능)

## 예제 10) Line Chart

조건

- **nginx-\* index** 중에서
- "@timestamp" field 기준 **"2018-06-11 ~ 2018-08-12"** documents를
- "**nginx.access.body\_sent.bytes**" field의 **평균이 가장 큰**
- "**nginx.access.geoip.country\_name**" field **2개**에 대해서
- "@timestamp" field를 기준으로 **일별(daily)** bucket을 생성한 후
- "**nginx.access.body\_sent.bytes**"의 **50백분위수**와 **75백분위수**

(split chart) 국가별

(x축) 일별

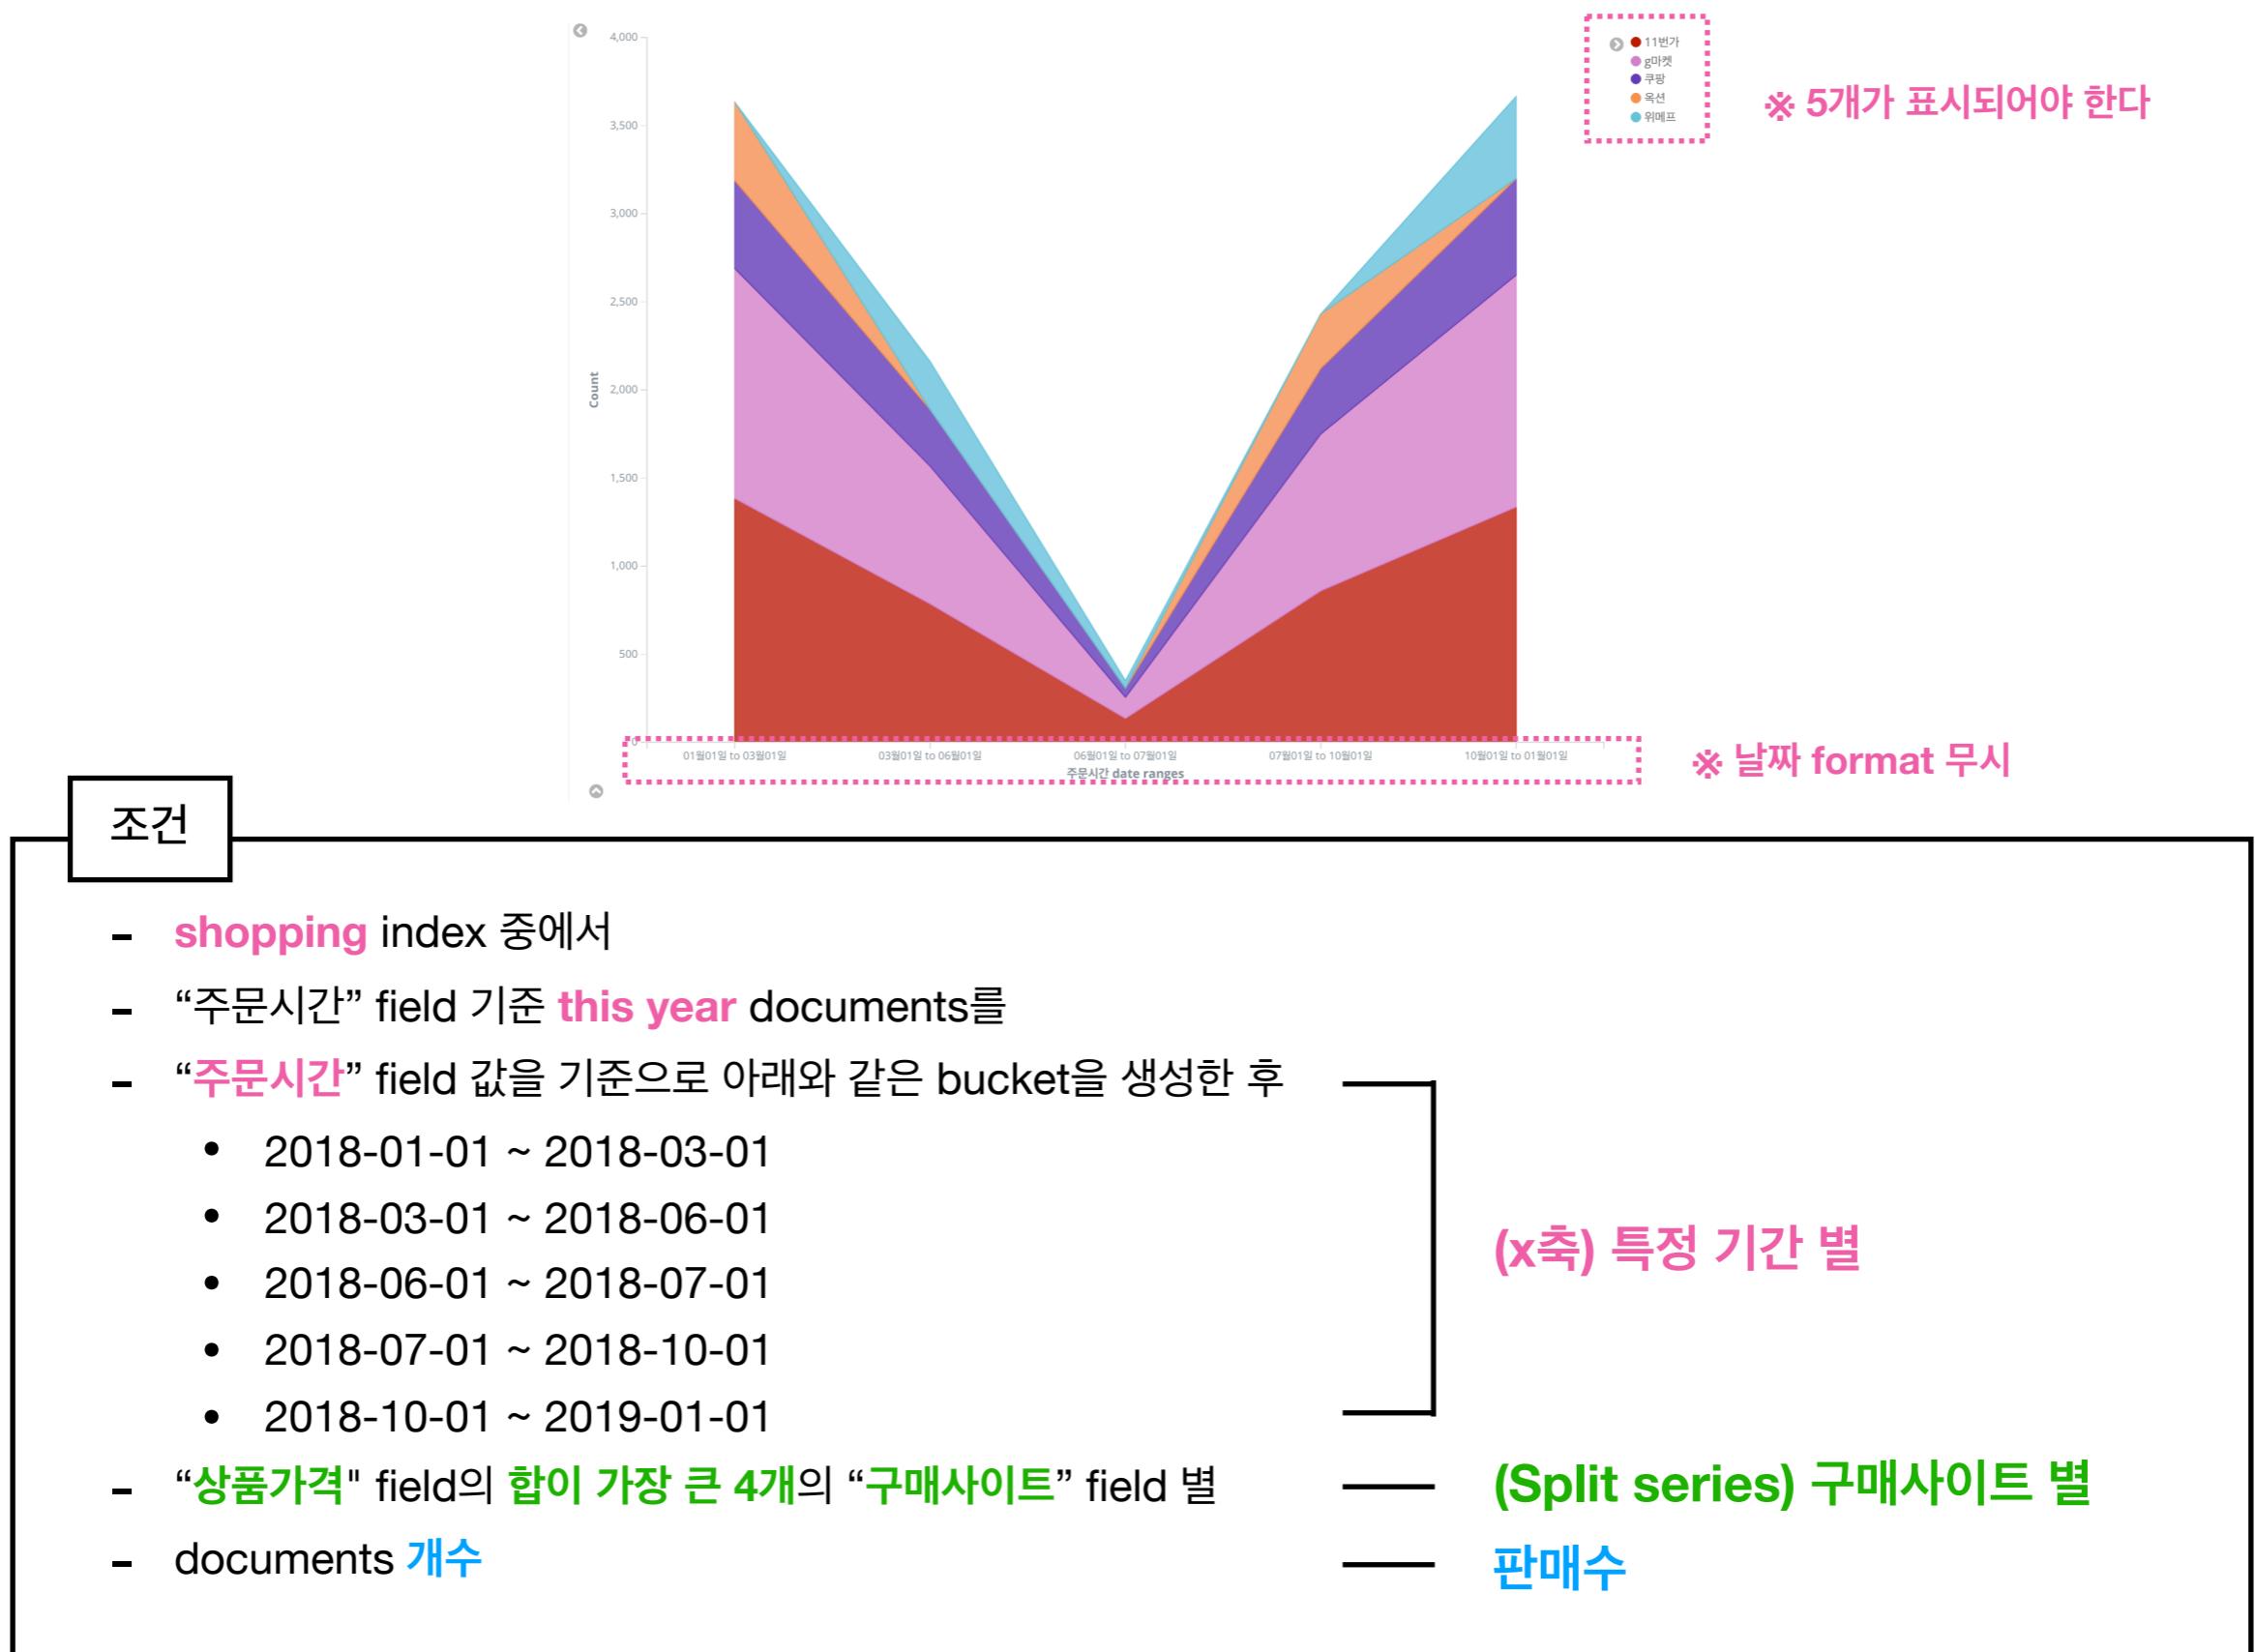

데이터 크기

# Area Chart

- x축의 변화에 따른 특정 field의 값의 추이를 볼 때 사용
- 주로 x축은 날짜/시간 관련 field를 사용
- area 내부도 이용할 수 있어 (line chart 대비) 한 차원 높은 분석 가능
- kibana 설정은 line // bar // area 모두 유사

## 예제 11) Area Chart

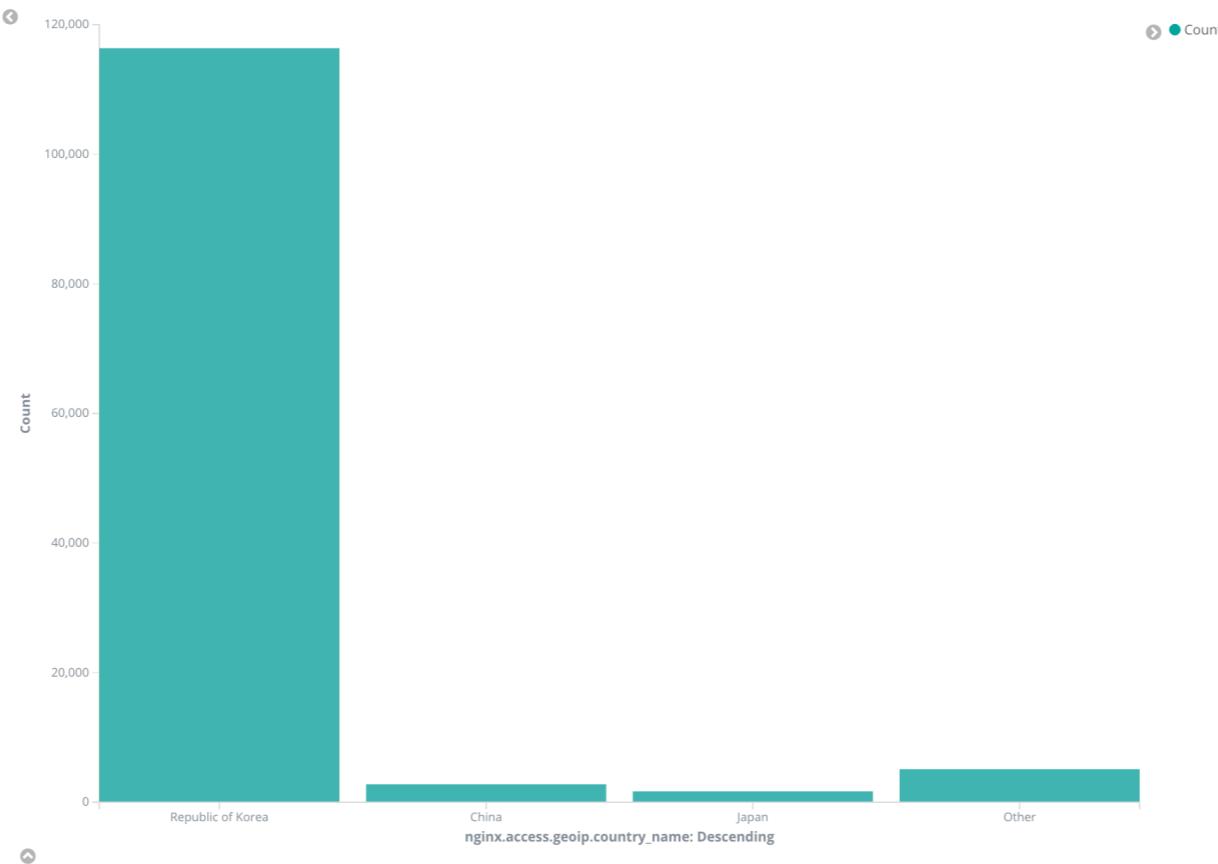

## Vertical Bar

Vertical Bar

- x축의 변수에 따른 특정 field 값을 시각화 할 때 사용
- 필수는 아니나 x축에는 주로 ordinal value 사용 (예: 20~29, 30~39, 40~49 등)
- kibana 설정은 line // bar // area 모두 유사

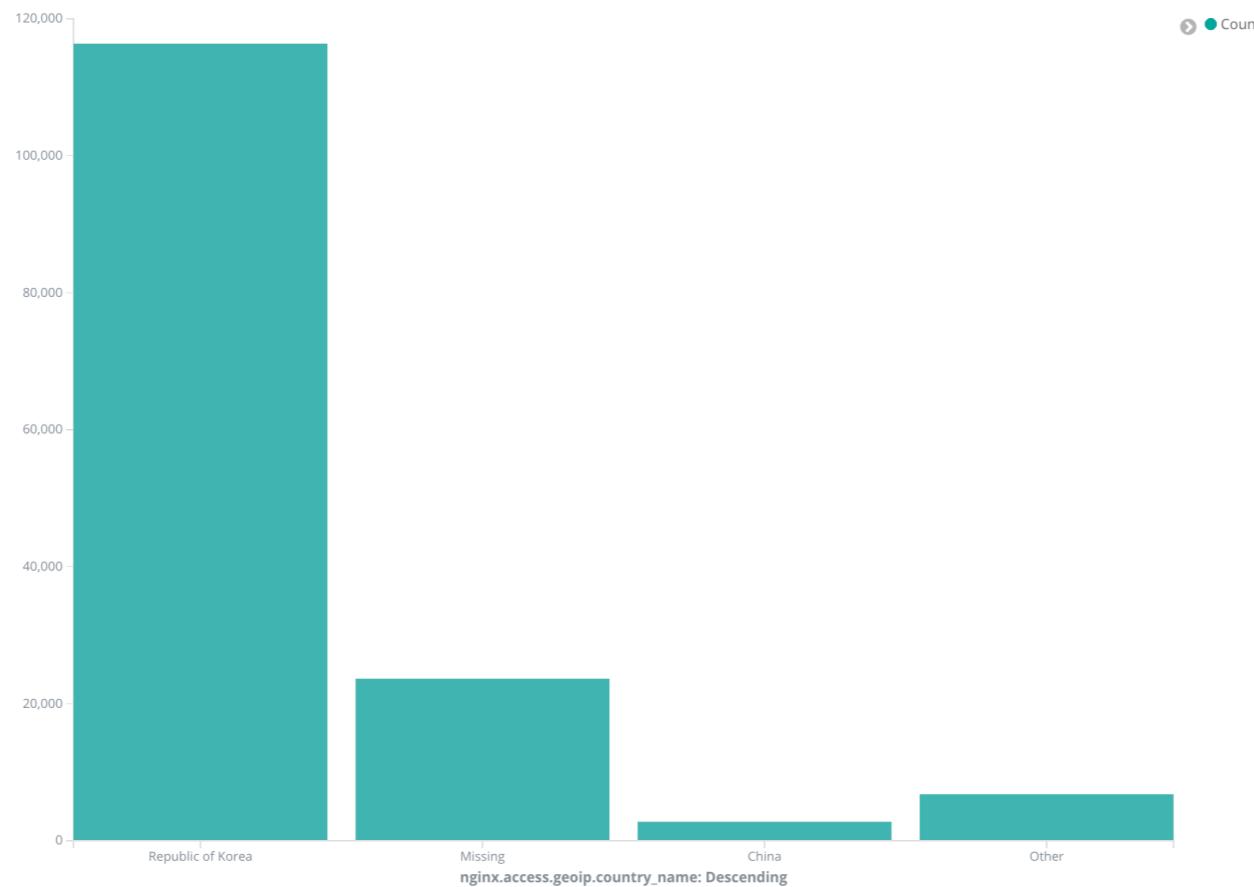

## 예제 12) Vertical Bar

조건

- nginx-\* index 중에서
- “주문시간” field 기준 “**2018-06-01 ~ 2018-08-12**” documents를
- documents 개수가 가장 많은 3개의 nginx.access.geoip.country\_name 별 — 국가별
- documents 개수
- (단, 그 외의 nginx.access.geoip.country\_name는 others로 묶어서 표시) — 접속수

## 예제 13) Vertical Bar

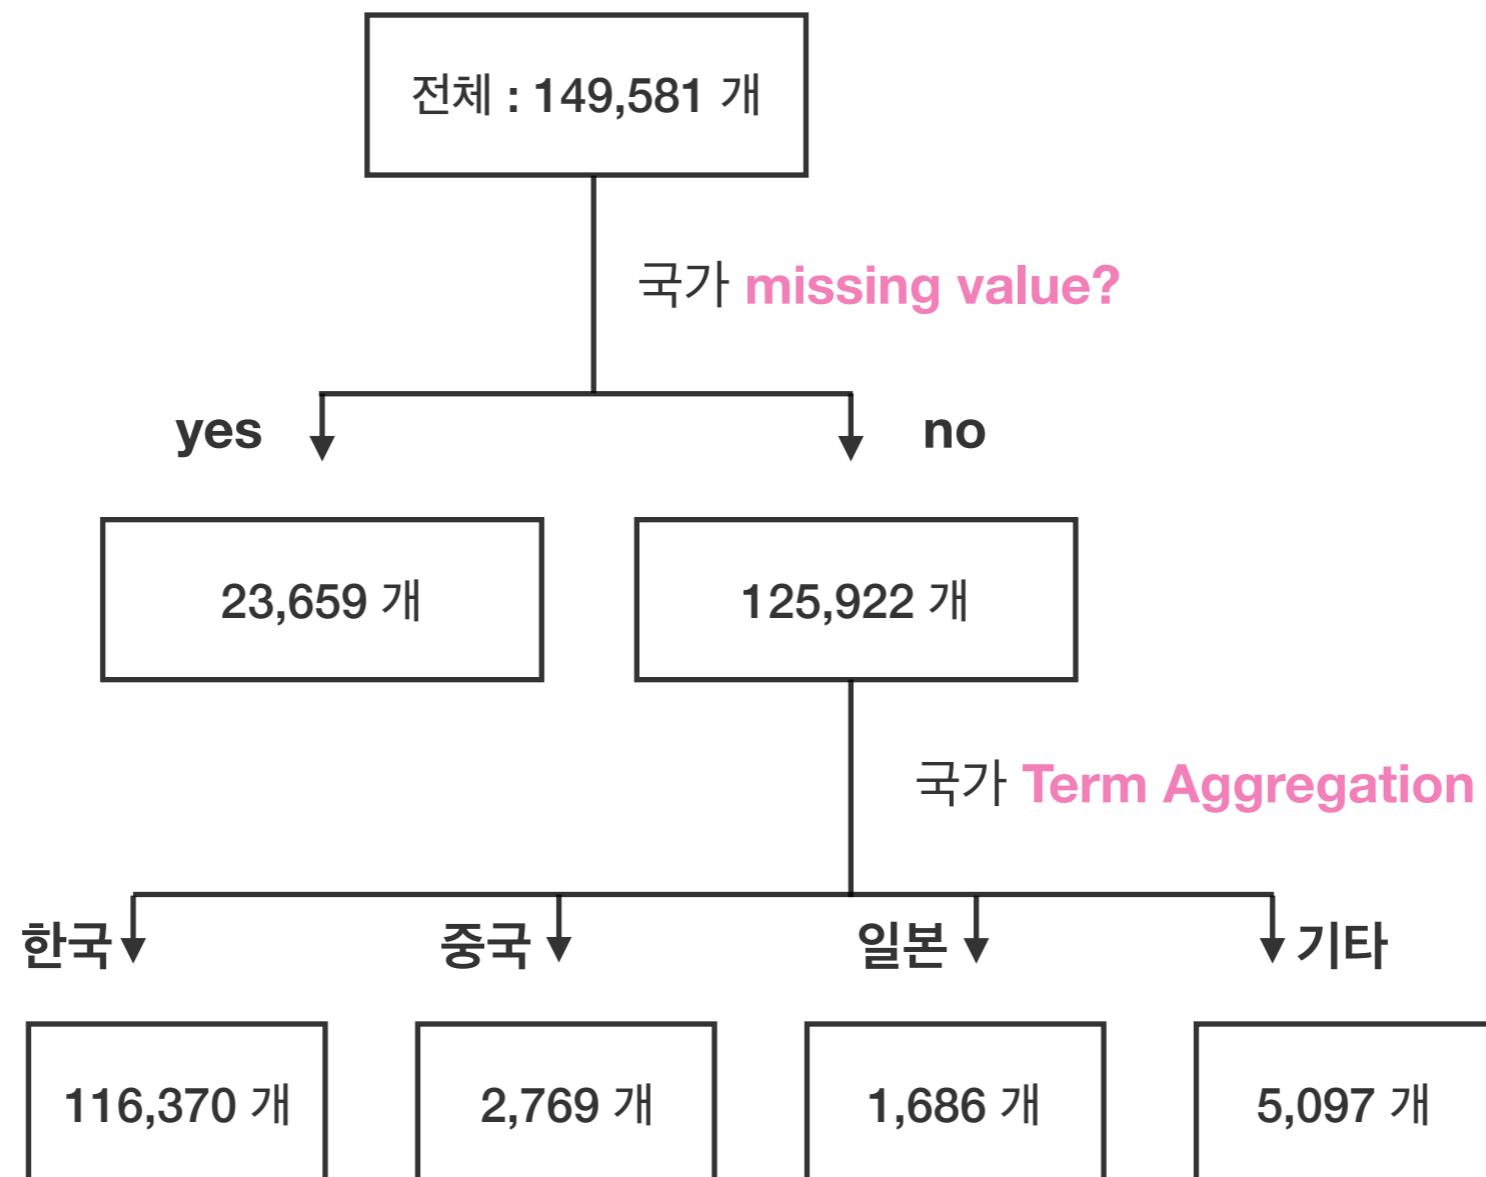

조건

- nginx-\* index 중에서
- “주문시간” field 기준 “**2018-06-01 ~ 2018-08-12**” documents를
- **documents 개수가 가장 많은 3개의 nginx.access.geoip.country\_name 별** — 국가별
- documents **개수**
- 단
  - 그 외 nginx.access.geoip.country\_name field는 others로 묶어서 표시
  - 만약 nginx.access.geoip.country\_name field가 missing일 경우 별도 표시— 접속수

**잠깐3, 옵션을 제대로 보고 넘어가자**

## 데이터 현황

missing option	others option	(표시되는) missing 개수	(표시되는) others 개수
<input type="checkbox"/> Show missing values 	<input type="checkbox"/> Group other values in separate bucket 	0	0
<input type="checkbox"/> Show missing values 	<input checked="" type="checkbox"/> Group other values in separate bucket 	0	5,097
<input checked="" type="checkbox"/> Show missing values 	<input type="checkbox"/> Group other values in separate bucket 	23,659	0
<input checked="" type="checkbox"/> Show missing values 	<input checked="" type="checkbox"/> Group other values in separate bucket 	23,659	6,783

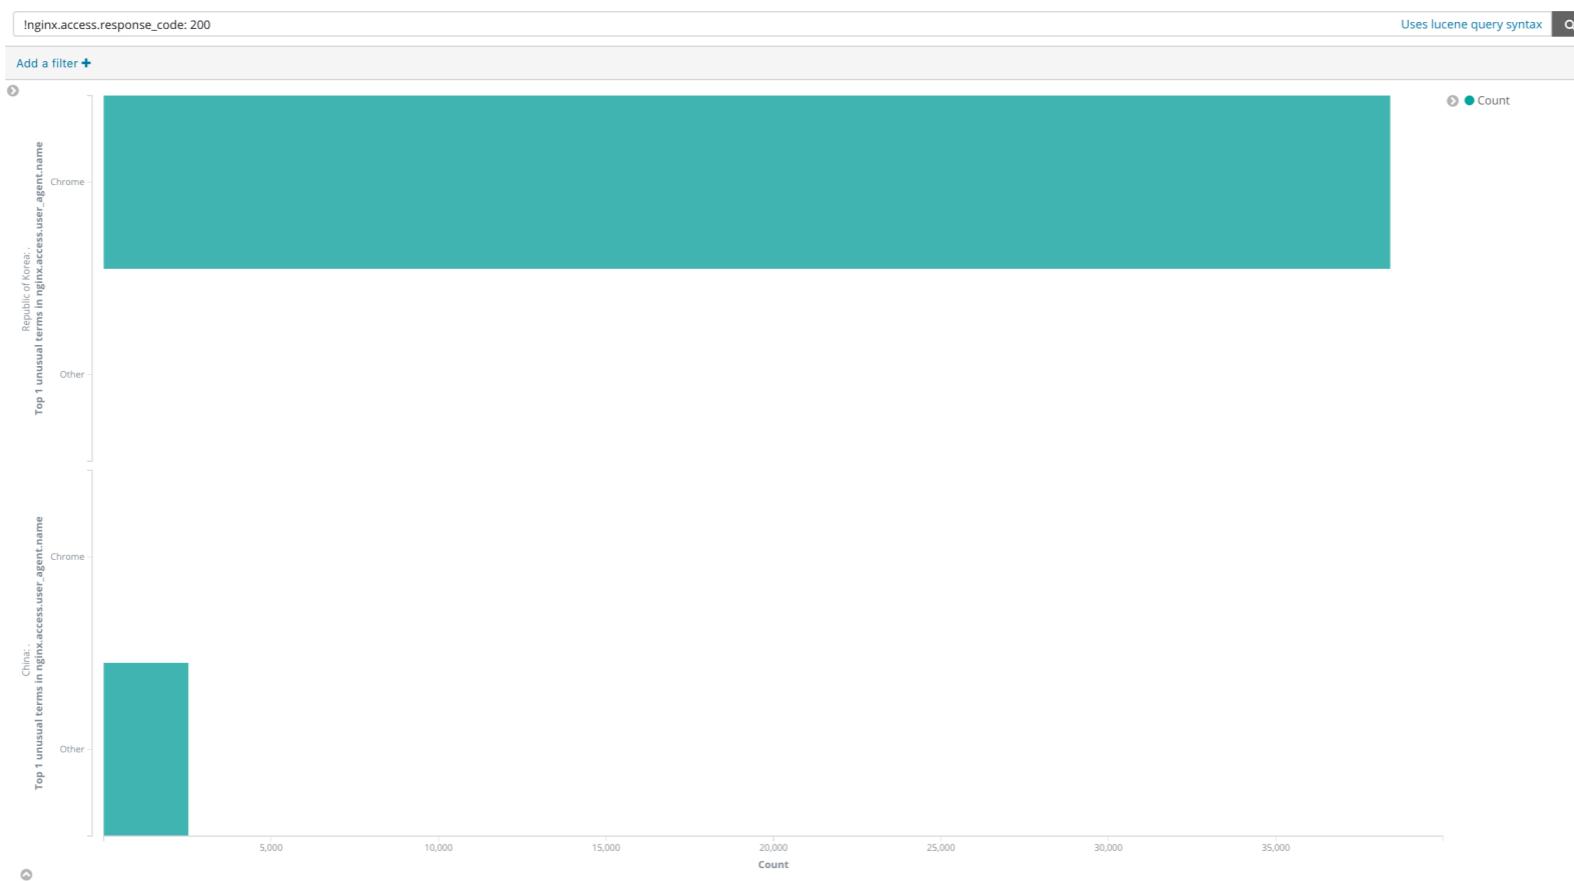

## Horizontal Bar

Horizontal Bar

- Vertical Bar와 유사한 용도
- 단, Vertical Bar와는 달리 x축에는 주로 nominal value를 사용 (예: 한국/중국/일본)
- kibana 설정은 line // bar // area 모두 유사

## 예제 14) Horizontal Bar

조건

- nginx-\* index 중에서
- "@timestamp" field 기준 "2018-06-01 ~ 2018-08-12" documents로 필터링한 후의
- documents 개수가 가장 많은 2개의 nginx.access.geoip.country\_name 별 — (Split Chart) 국가별
- 전체 documents 대비
- "nginx.access.response\_code" field가 200이 아닌 documents 중에서
- 특별한 "nginx.access.user\_agent.name" field로 bucket을 1개 생성한 후 — (x축)  
(응답코드가 200이 아닌 데이터 중에서)  
특별한 user\_agent.name 별
- 각 bucket별 document 개수 — 접속수

**잠깐4, 한국과 중국에서 Chrome과 Others는 왜 나왔지?**

# Goal

8

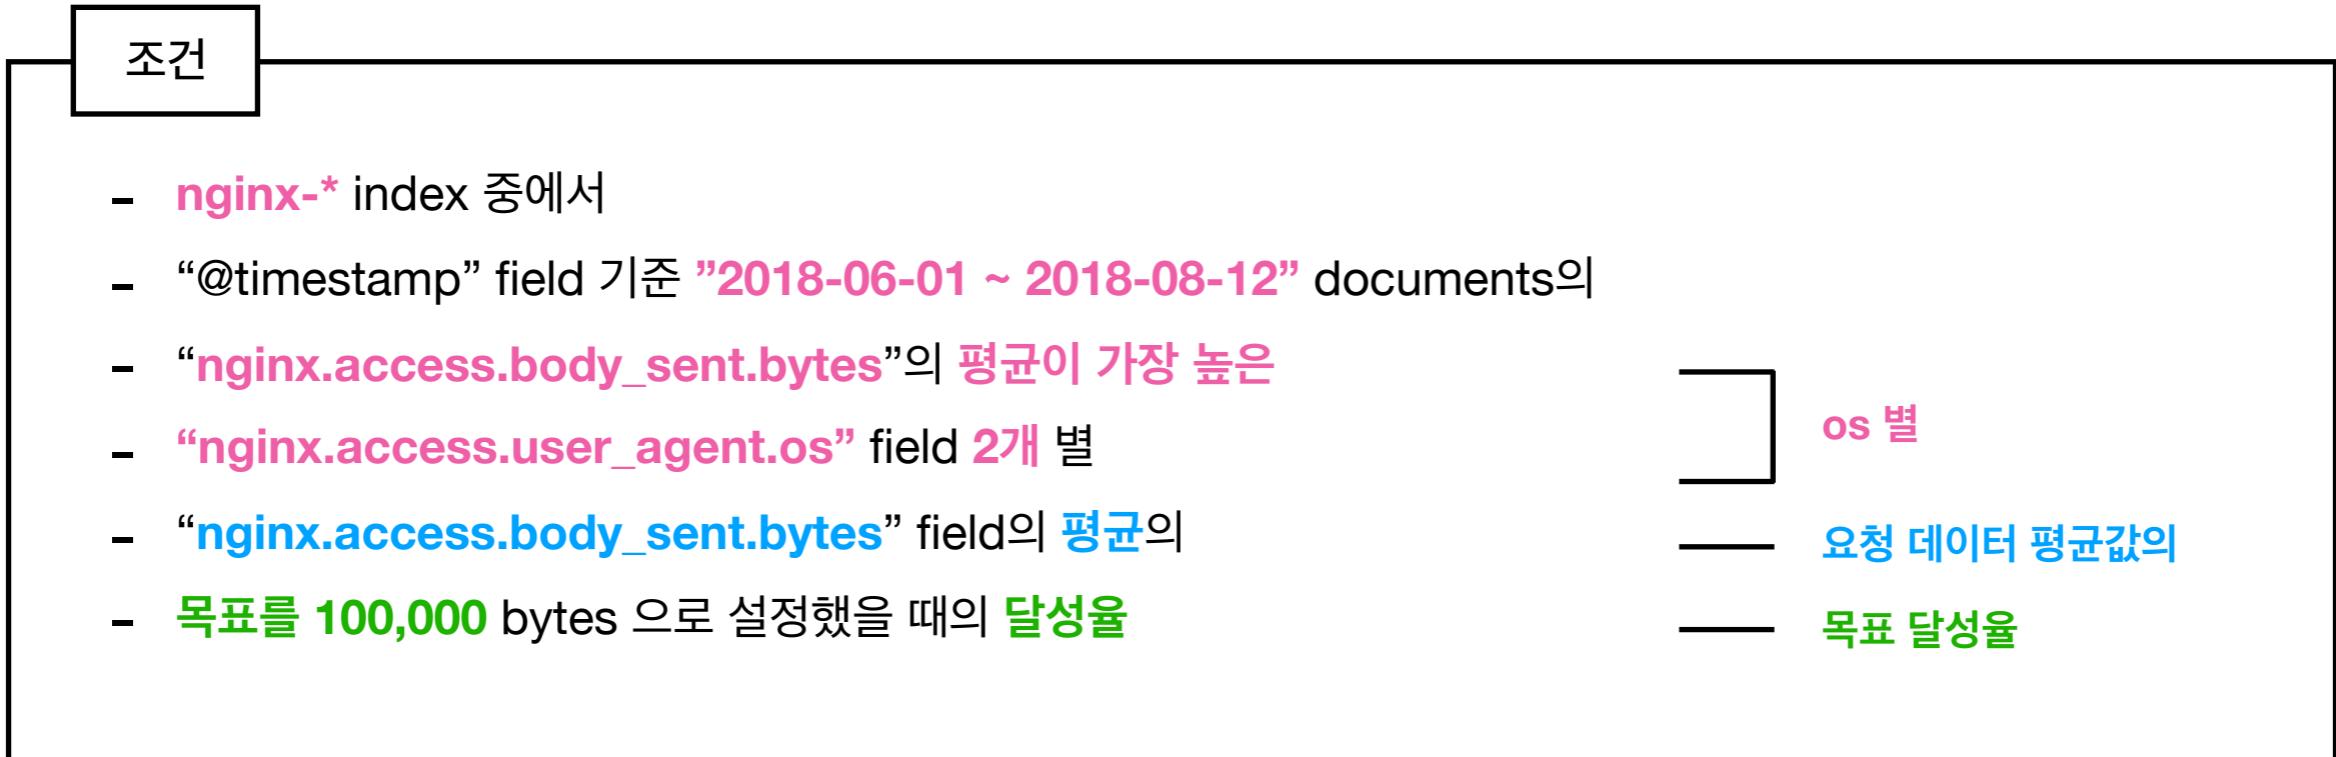

Goal

- 직접 설정한 목표 대비 현재 어느 정도 달성했는지 시각화 할 때 사용

## Goal Object

Average nginx.access.body\_sent.bytes

## Goal Configuration 1

The screenshot shows the Grafana interface for configuring a goal named 'nginx-\*'. The 'Options' tab is selected. A pink box highlights the '⑧ 선택' button at the top right. The configuration area is divided into sections: Metrics, Aggregation, Field, Custom Label, Buckets, and Order By.

- Metrics:** Metric dropdown is set to 'Metric'.
- Aggregation:** Average dropdown is highlighted with a blue border.
- Field:** nginx.access.body\_sent.bytes dropdown is highlighted with a blue border.
- Custom Label:** An empty input field.
- Buckets:**
  - Split Group dropdown is set to 'Terms'.
  - Field dropdown is set to nginx.access.user\_agent.os.
  - Order By dropdown is set to metric: Average nginx.access.body\_sent.
  - Order dropdown is set to Descending.
  - Size input field is set to 2.

**⑦ 정렬방식 선택 (오름/내림)** (Step 7: Select sorting method (Ascending/Descending))

**⑧ 선택** (Step 8: Select)

**① Average Aggregation 선택** (Step 1: Select Average Aggregation)

**② Average Aggregation 적용할 Field 선택** (Step 2: Select the Field to apply Average Aggregation)

**③ Terms Aggregation 선택** (Step 3: Select Terms Aggregation)

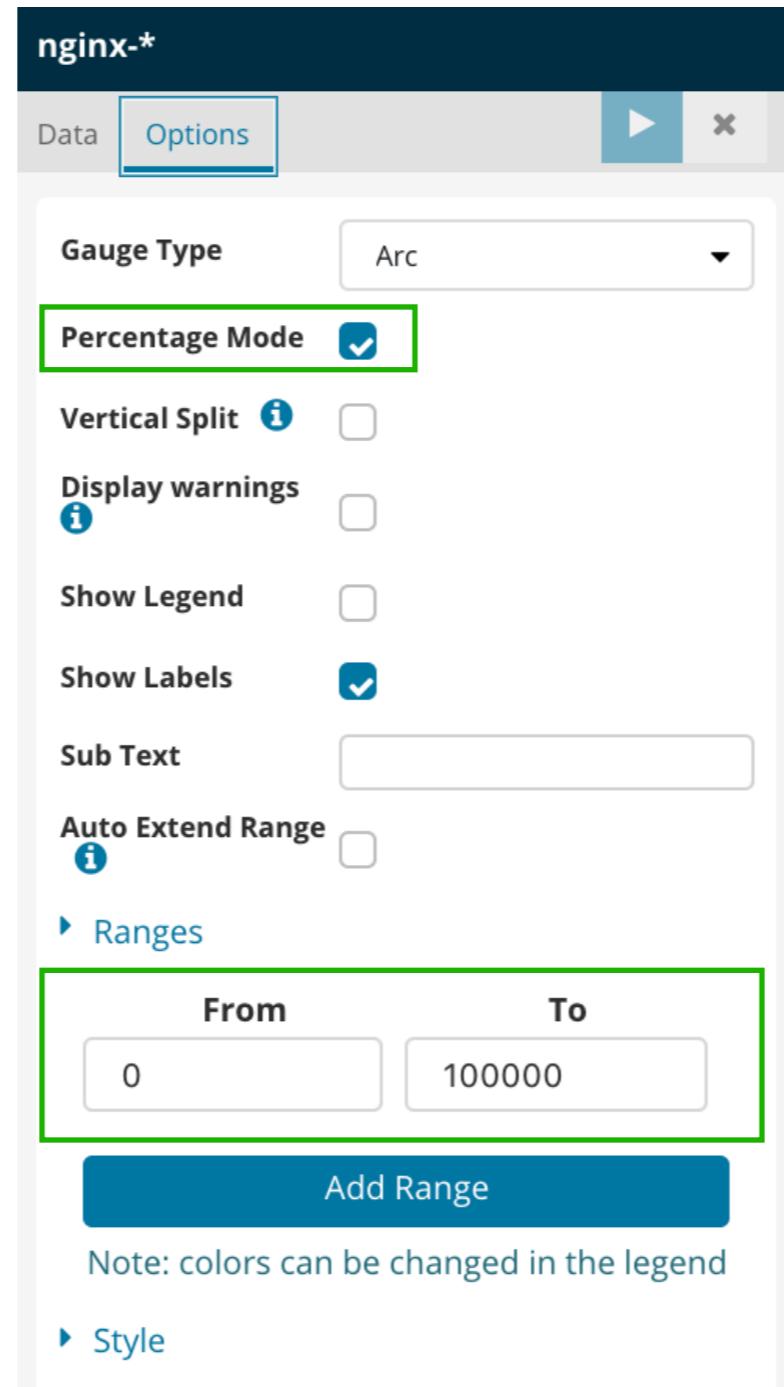

**④ Terms Aggregation 적용할 Field 선택** (Step 4: Select the Field to apply Terms Aggregation)

**⑤ bucket 선정을 위한 metric 선택** (Step 5: Select the metric for bucket selection)

**⑥ 반영할 bucket 개수 입력** (Step 6: Enter the number of buckets to reflect)

## Goal Configuration 2

⑨ 백분율로 표시하기 위해 선택

⑩ 목표치 설정

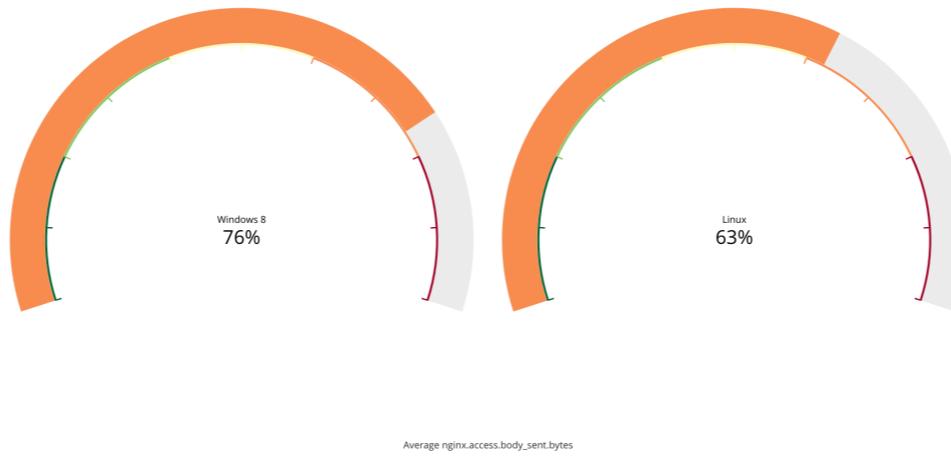

## Gauge

Gauge

- 직접 설정한 목표 대비 현재 어느 정도 달성했는지 단계별로 시각화 할 때 사용

## Gauge Object

### 조건

- **nginx-\* index** 중에서
- "@timestamp" field 기준 "**2018-06-01 ~ 2018-08-12**" documents의
- "**nginx.access.body\_sent.bytes**"의 평균이 가장 높은
- "**nginx.access.user\_agent.os**" field **2개** 별
- "**nginx.access.body\_sent.bytes**" field의 **평균**의
- **단계별 목표**를 아래와 같이 설정했을 때의 **달성을**
  - 0 ~ 20000
  - 20000 ~ 40000
  - 40000 ~ 60000
  - 60000 ~ 80000

## Gauge Configuration 1

The screenshot shows the 'Gauge Configuration 1' interface for an 'nginx-\*' source. The configuration is divided into two main sections: Metrics and Buckets.

**Metrics Section:**

- Metric:** A dropdown menu currently set to "Metric".
- Aggregation:** A dropdown menu currently set to "Average".
- Field:** A dropdown menu currently set to "nginx.access.body\_sent.bytes".
- Custom Label:** An input field for custom labels, currently empty.
- Add metrics:** A button to add more metrics.

**Buckets Section:**

- Split Group:** A section with a "Split Group" button and a red 'X' button.
- Aggregation:** A dropdown menu currently set to "Terms".
- Field:** A dropdown menu currently set to "nginx.access.user\_agent.os".
- Order By:** A section with the metric "metric: Average nginx.access.body\_sent." followed by an up/down arrow icon.
- Order:** A dropdown menu currently set to "Descending".
- Size:** An input field currently set to "2".

**Buttons at the Top:**

- Data

## Data Table Configuration 1

The screenshot shows the 'Data Table Configuration' interface for the 'nginx-\*' data source. The configuration is divided into two main sections:

- Metrics**:
  - Metric**: Count (selected)
  - Custom Label**: 개수
- Metric**: Average (selected)
  - Aggregation**: Average
  - Field**: nginx.access.body\_sent.bytes
  - Custom Label**: 평균 데이터 크기

At the bottom right of the configuration panel, there is an 'Advanced' button and an 'Add metrics' button.

- ① Count Aggregation 선택
- ② Data Table Column 이름에 표시될 Label 입력
- ③ Average Aggregation 선택
- ④ Average Aggregation 적용할 Field 선택
- ⑤ Data Table Column 이름에 표시될 Label 입력
- ⑥ 스크롤 다운

## Data Table Configuration 2

⑯ 정렬방식 선택 (오름/내림)

The screenshot shows a configuration interface for a data table. It includes sections for Buckets, Aggregation, Field selection, Interval, Custom Label, Sub Aggregation, Order By, and Size. The interface is annotated with numbers 7 through 26, corresponding to the steps listed below. The 'Date Histogram' aggregation is selected, and the 'Daily' interval is chosen. A custom label '날짜' is used for the Date Histogram bucket. The 'Terms' aggregation is selected for the 'nginx.access.geoip.city\_name' field, with 'metric: 개수' as the order by metric and a size of 2. A custom label '도시' is used for this bucket. The 'Range' aggregation is selected for the 'nginx.access.body\_sent.bytes' field, with a range from 0 to 1000 and a size of 2. A custom label '데이터 크기' is used for this bucket. Finally, another 'Terms' aggregation is selected for the 'nginx.access.user\_agent.os' field, with 'metric: 개수' as the order by metric and a size of 2. A custom label 'os' is used for this bucket.

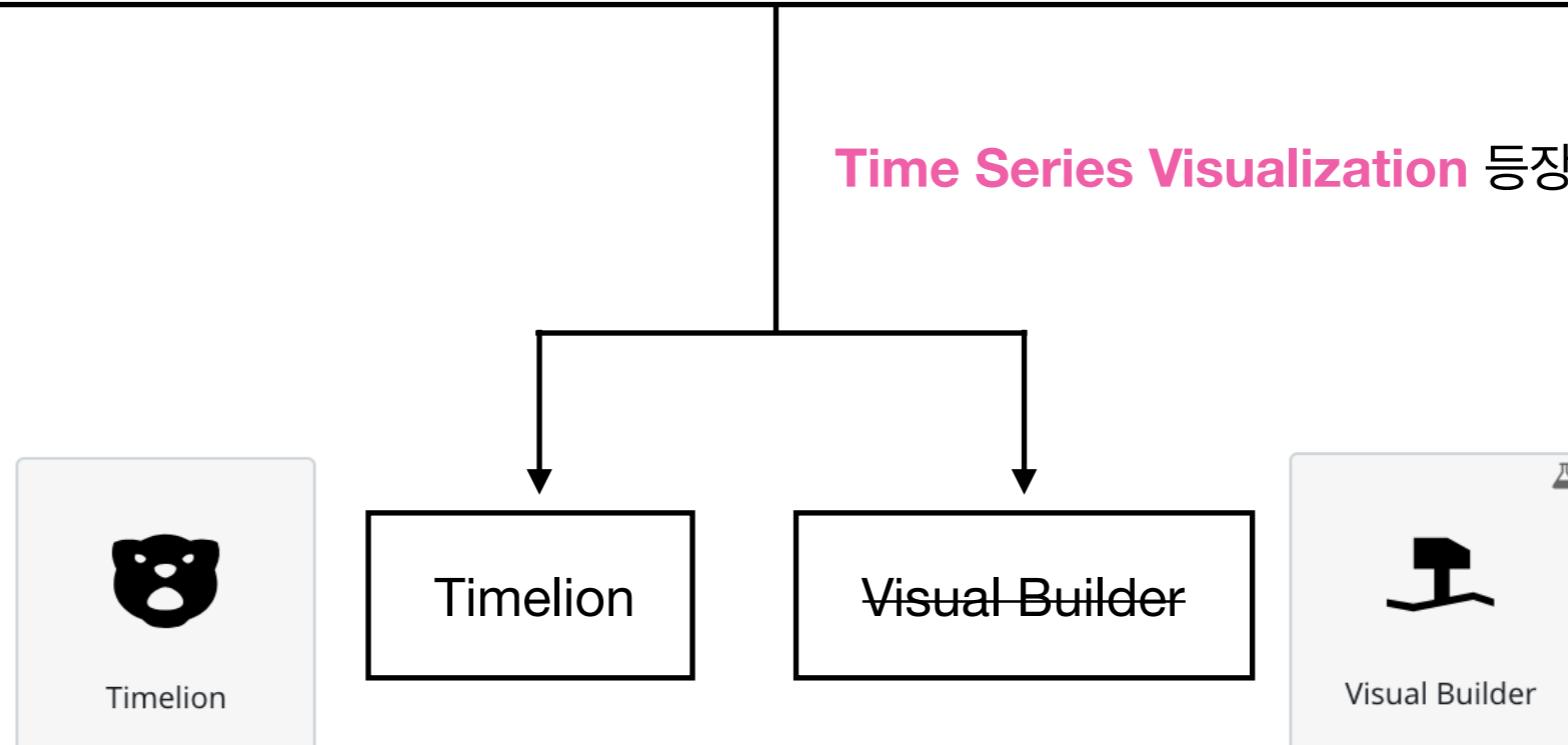

⑦ Date Histogram Aggregation 선택  
⑧ Date Histogram Aggregation 적용할 Field 선택  
⑨ Date Histogram 간격 선택  
⑩ Data Table Column 이름에 표시될 이름 입력  
⑪ Terms Aggregation 선택  
⑫ Terms Aggregation 적용할 Field 선택  
⑬ Terms Aggregation 후 bucket을 정렬할 때 사용할 metric 선택  
⑭ 사용할 bucket 개수 입력  
⑮ 정렬방식 선택 (오름/내림)  
⑯ Data Table Column 이름에 표시될 이름 입력  
⑰ Range Aggregation 선택  
⑱ Range Aggregation 적용할 Field 선택  
⑲ Range Aggregation bucket 구간 직접 입력  
⑳ Data Table Column 이름에 표시될 이름 입력  
㉑ Terms Aggregation 선택  
㉒ Terms Aggregation 적용할 Field 선택  
㉓ Terms Aggregation 후 bucket을 정렬할 때 사용할 metric 선택  
㉔ 사용할 bucket 개수 입력  
㉕ 정렬방식 선택 (오름/내림)  
㉖ Data Table Column 이름에 표시될 이름 입력

## Line/Bar/Area Chart로 시계열 데이터를 시각화하면서 아쉬운 점?

- 서로 다른 Index (Pattern) 의 데이터를 하나의 Visualization으로 시각화 못한다
- 특정 Field Value의 기준시점과 비교시점 값을 시각적으로 비교하기 어렵다

:

Time Series Visualization 등장

# 기본적으로 아래와 같은 함수를 제공한다

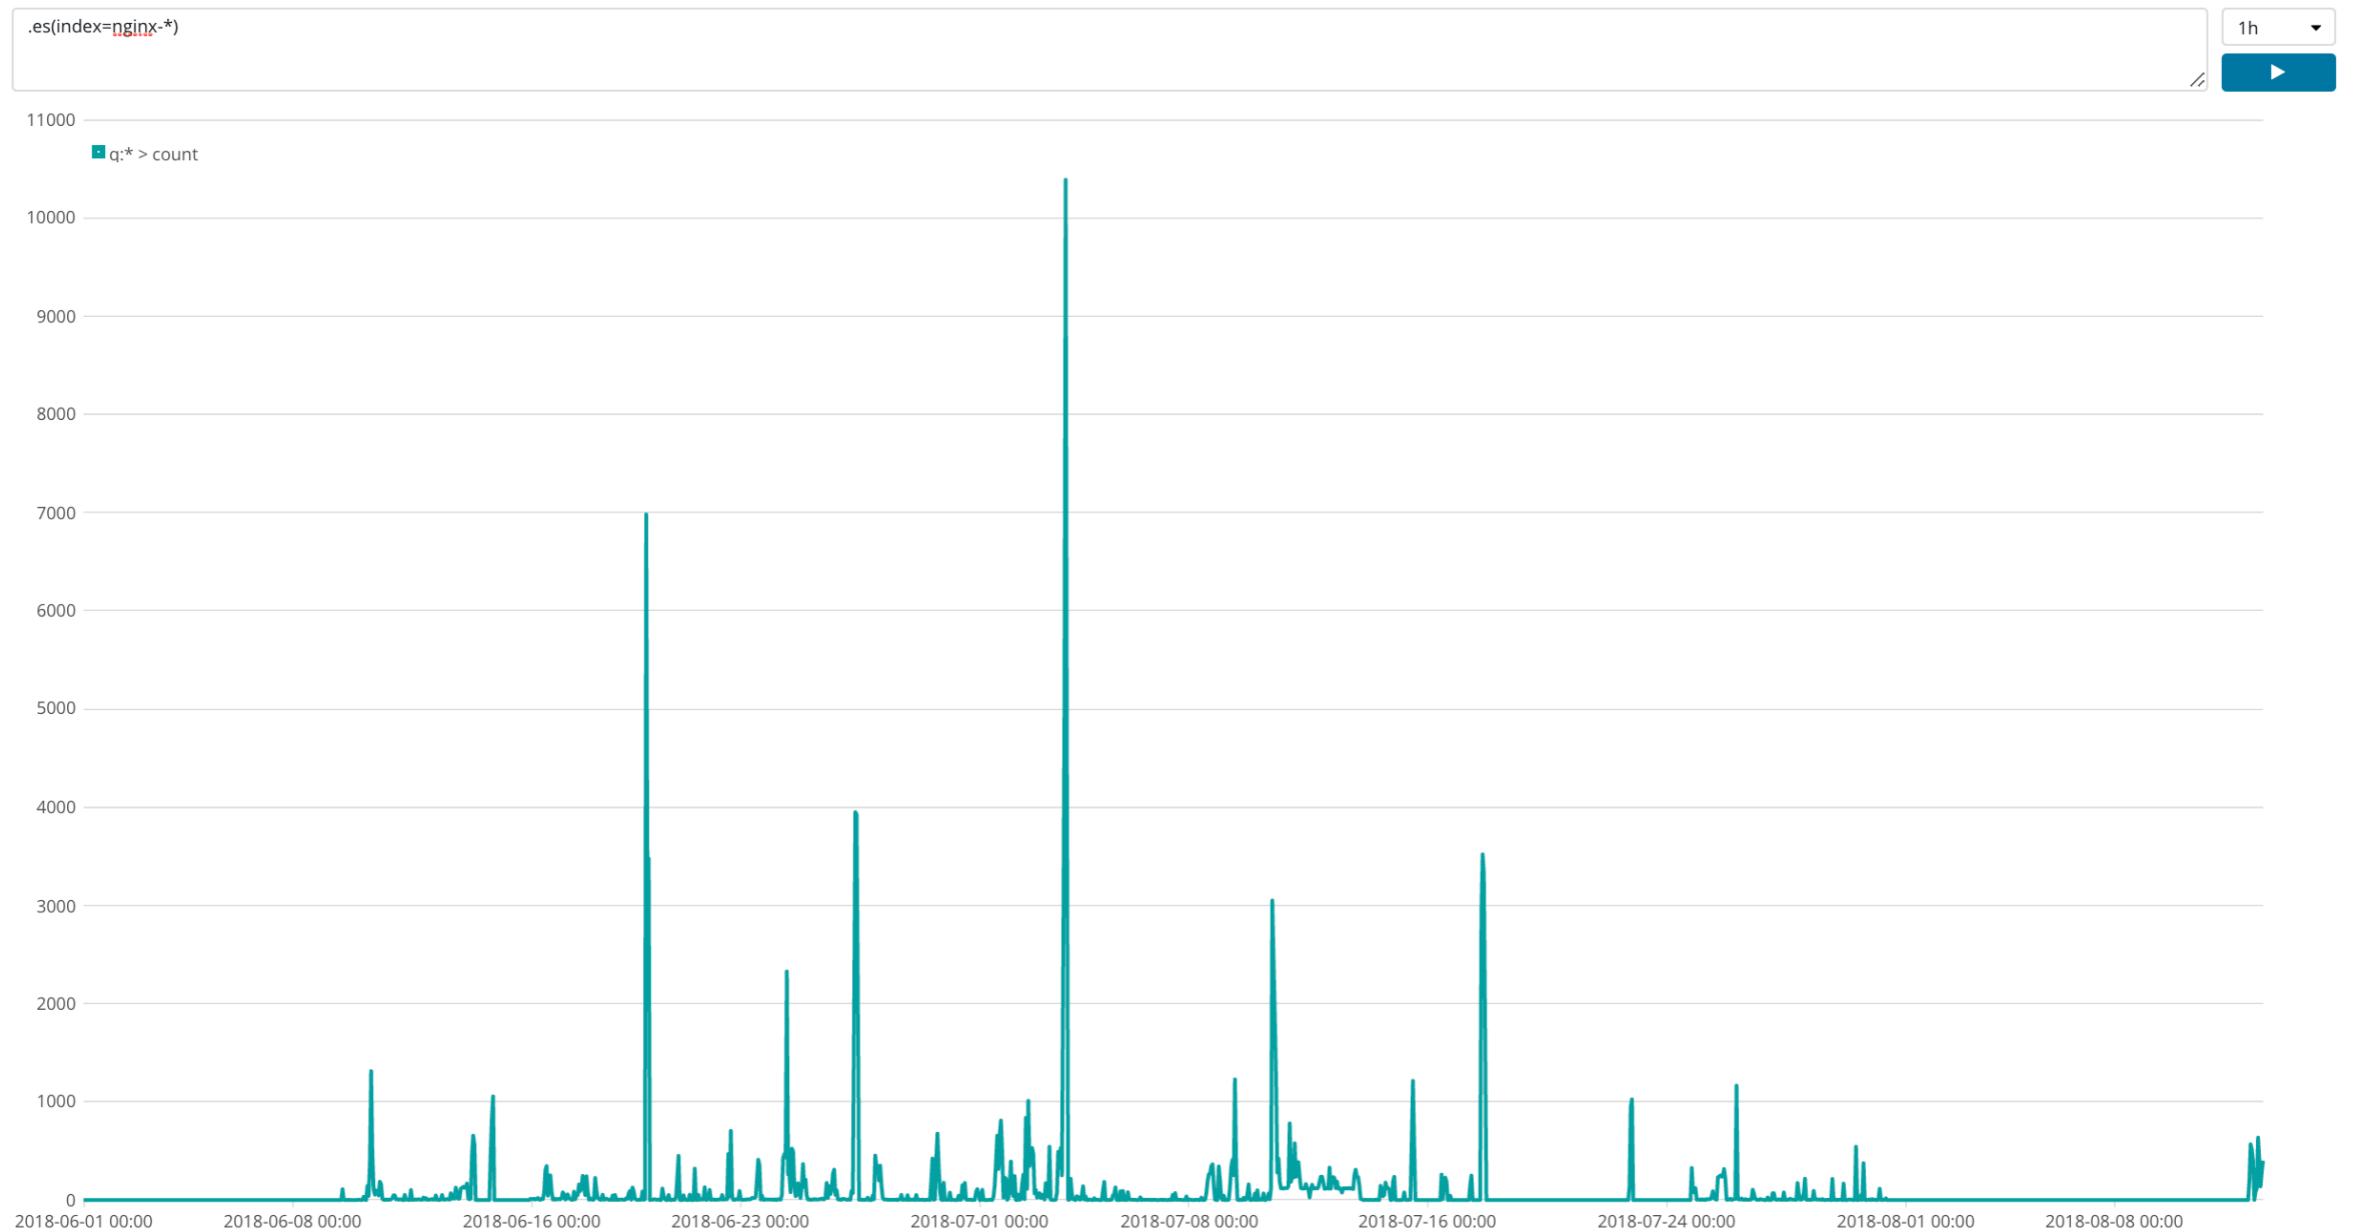

## 목록

- 기본함수 - `.es()`
- 조건함수 - `.es().if()`

시계열 데이터를 시각화 하는 데 있어 **기존 Visualization 과의 차이**에 집중하자

## 간단한 사용법을 보자

## 간단한 사용법을 보자

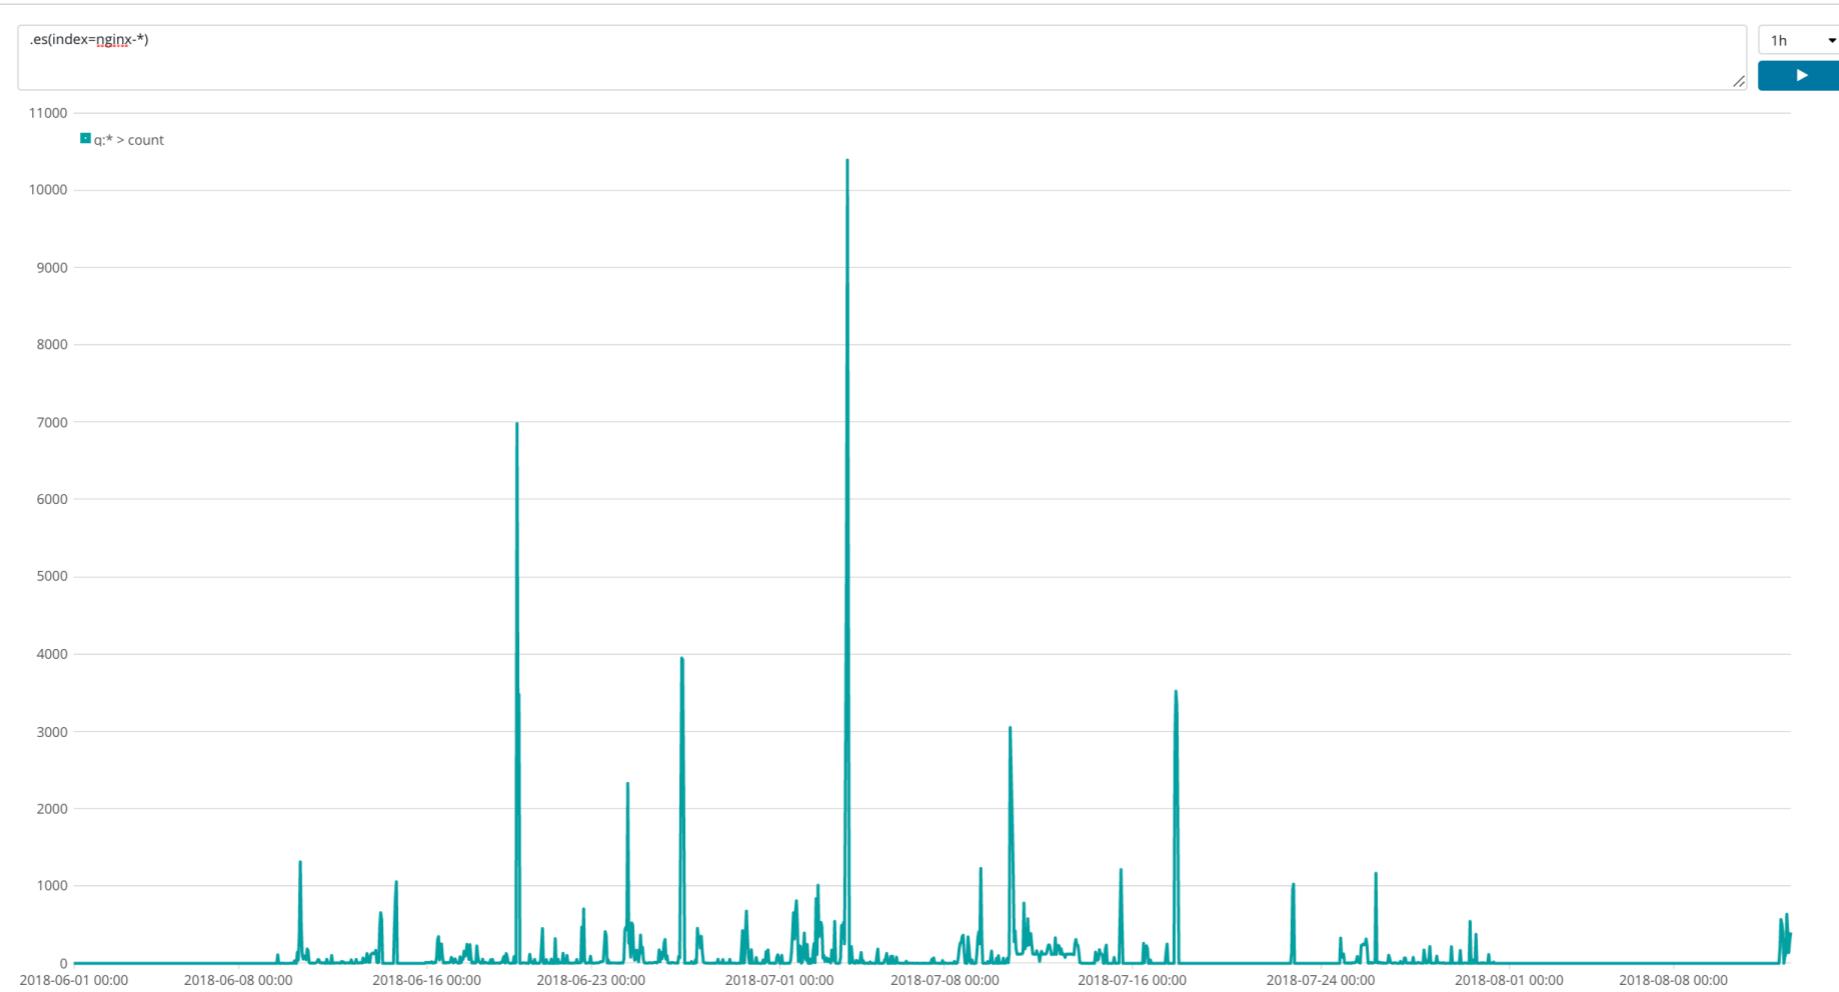

아래와 같이 설정을 고정하자

- Time Range : 2018-06-11 ~ 2018-08-12
- Interval : 1h
- 스크립트 : 

## Timelion - Index 설정

.es(index=nginx-\*)

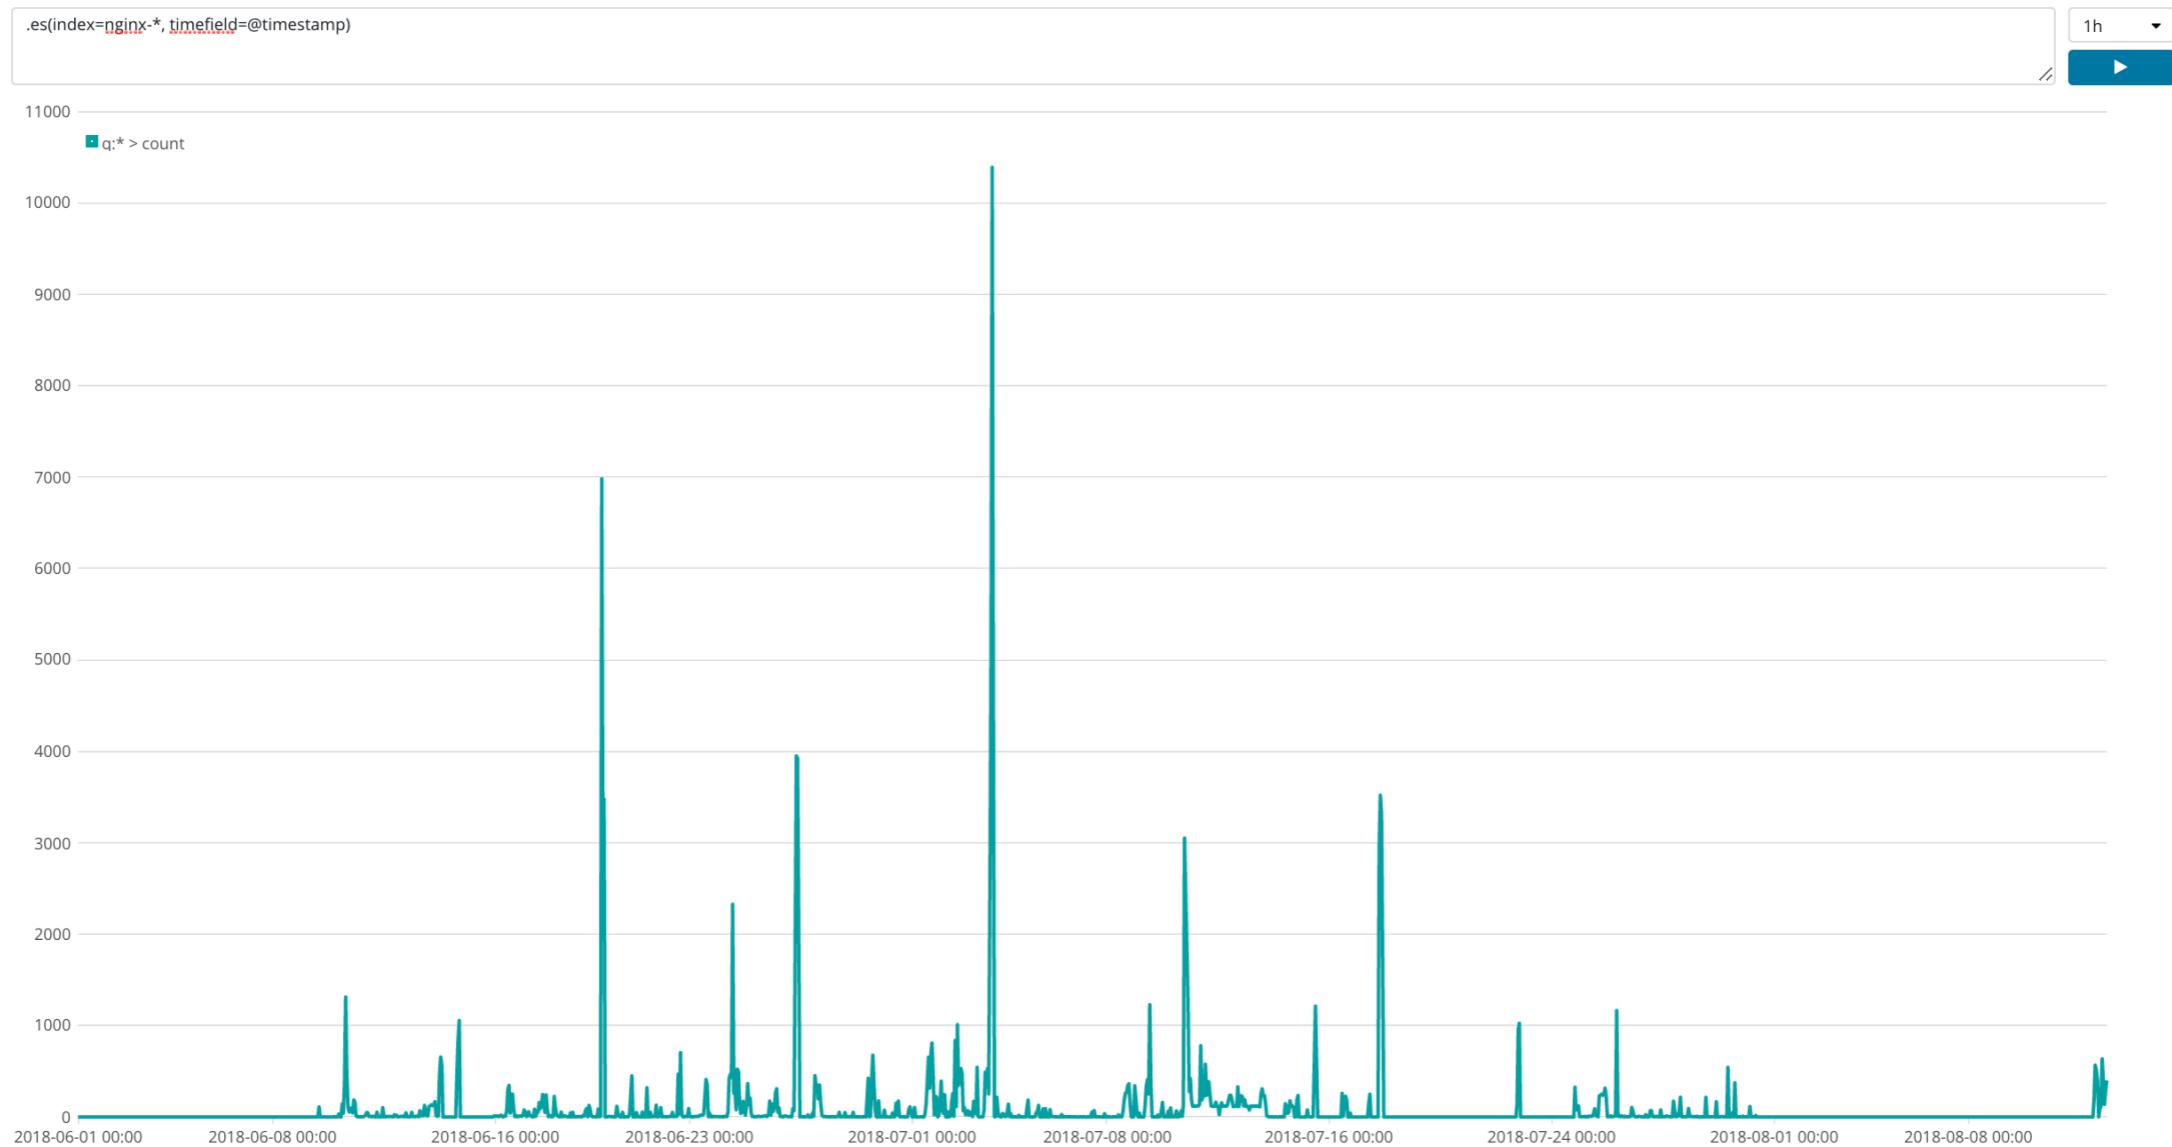

\* Kibana에서 Index Patterns에 등록하지 않고도 사용할 수 있다

## Timelion - timefield 설정

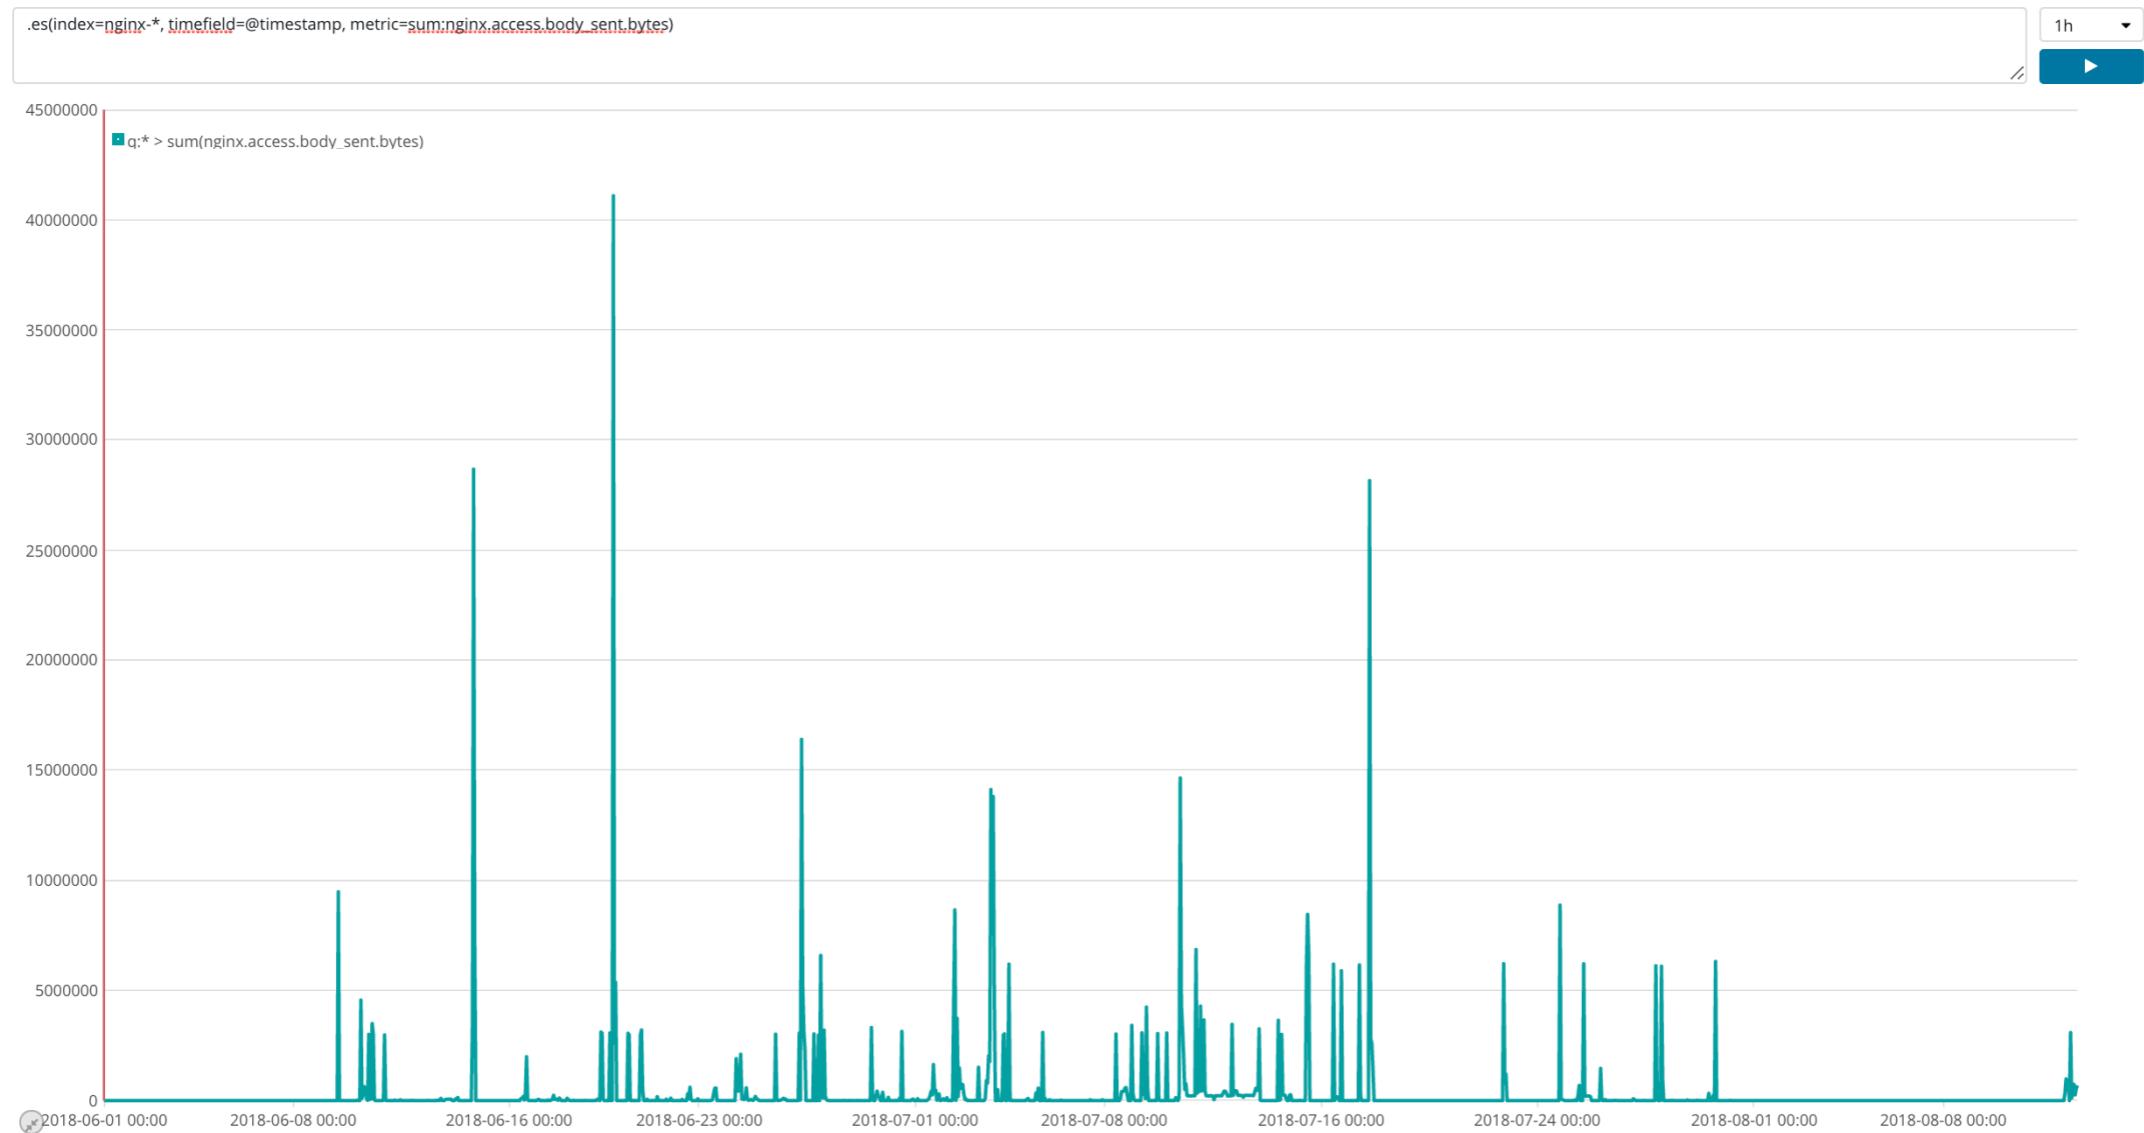

.es(index=nginx-\*, timefield=@timestamp)

\* default : @timestamp

## Timelion - metric 설정

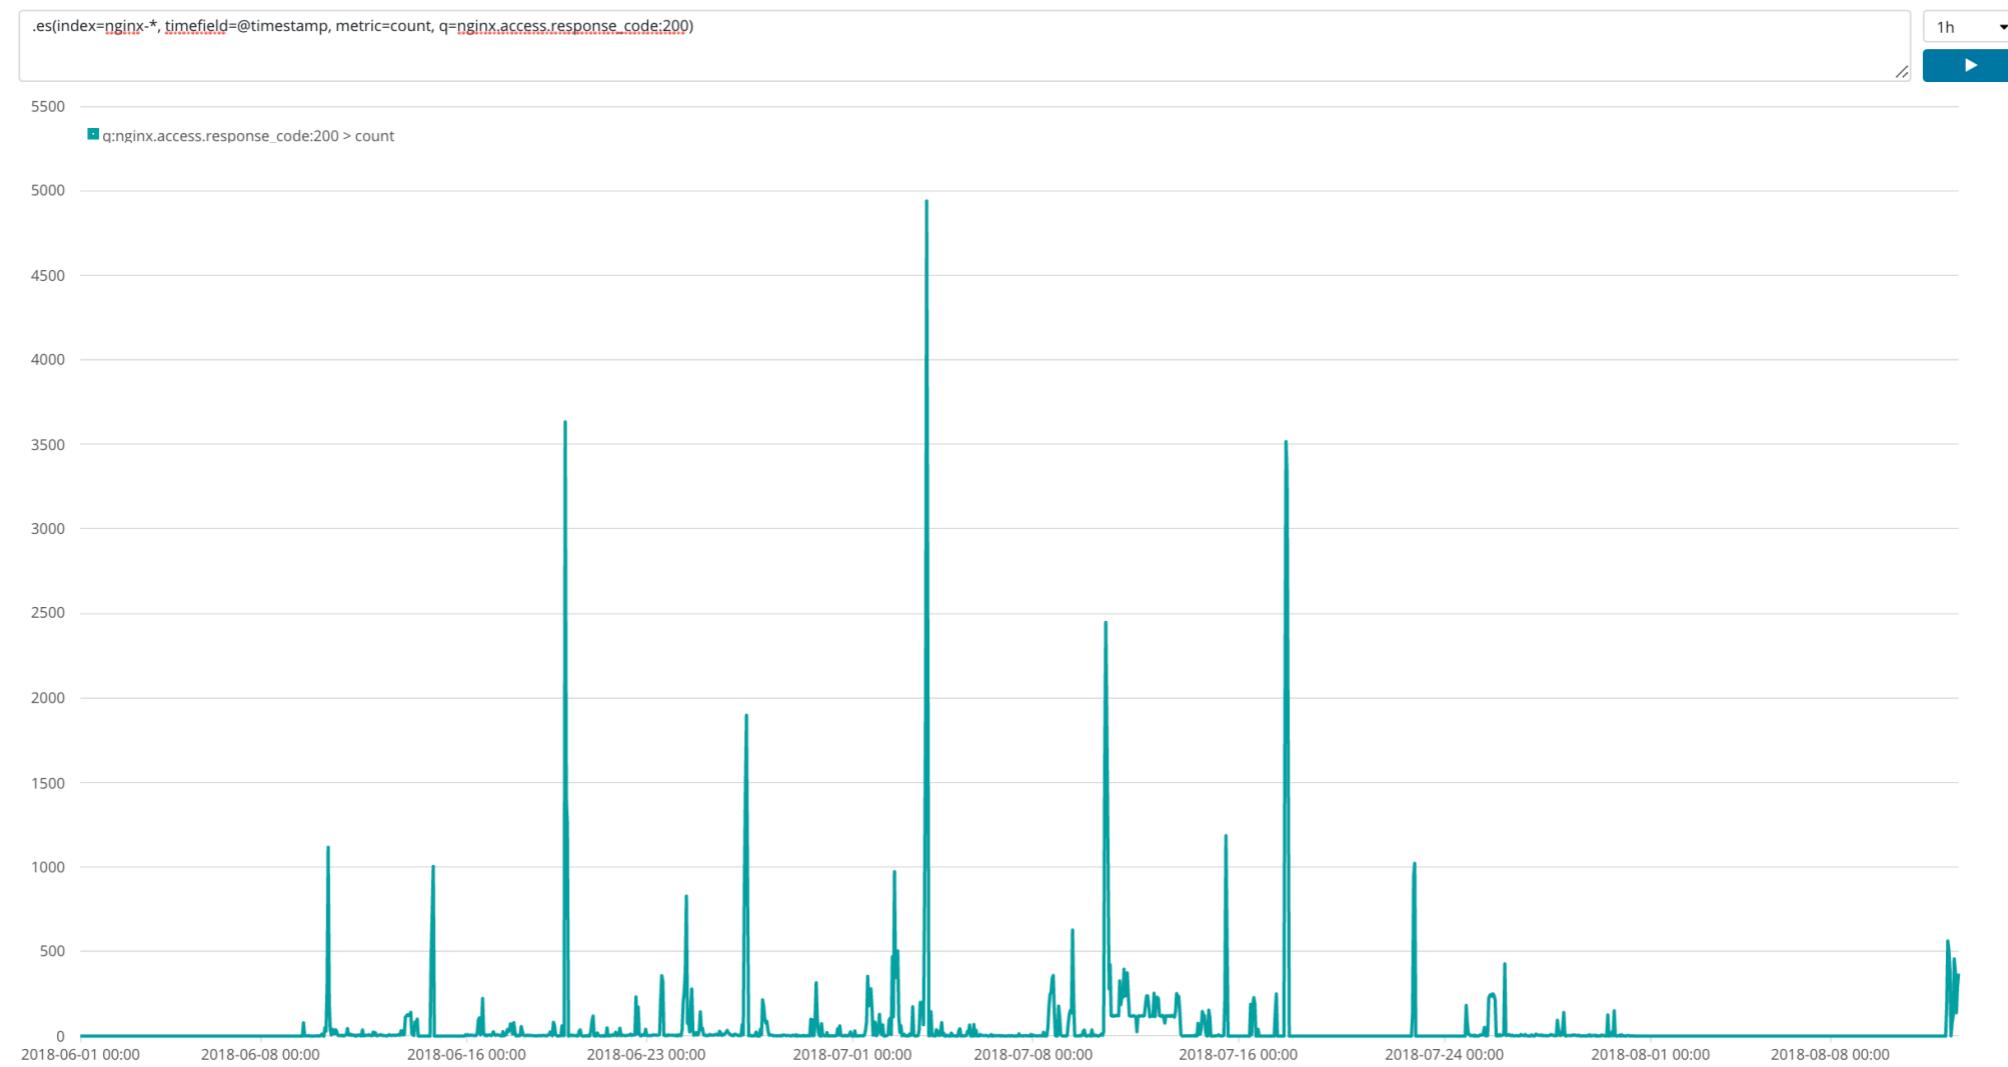

.es(index=nginx-\* , timefield=@timestamp, metric=sum:nginx.access.body\_sent.bytes)  **default : count**

## Timelion - query 설정

.es(index=nginx-\*, timefield=@timestamp, metric=count, q=nginx.access.response\_code:200)

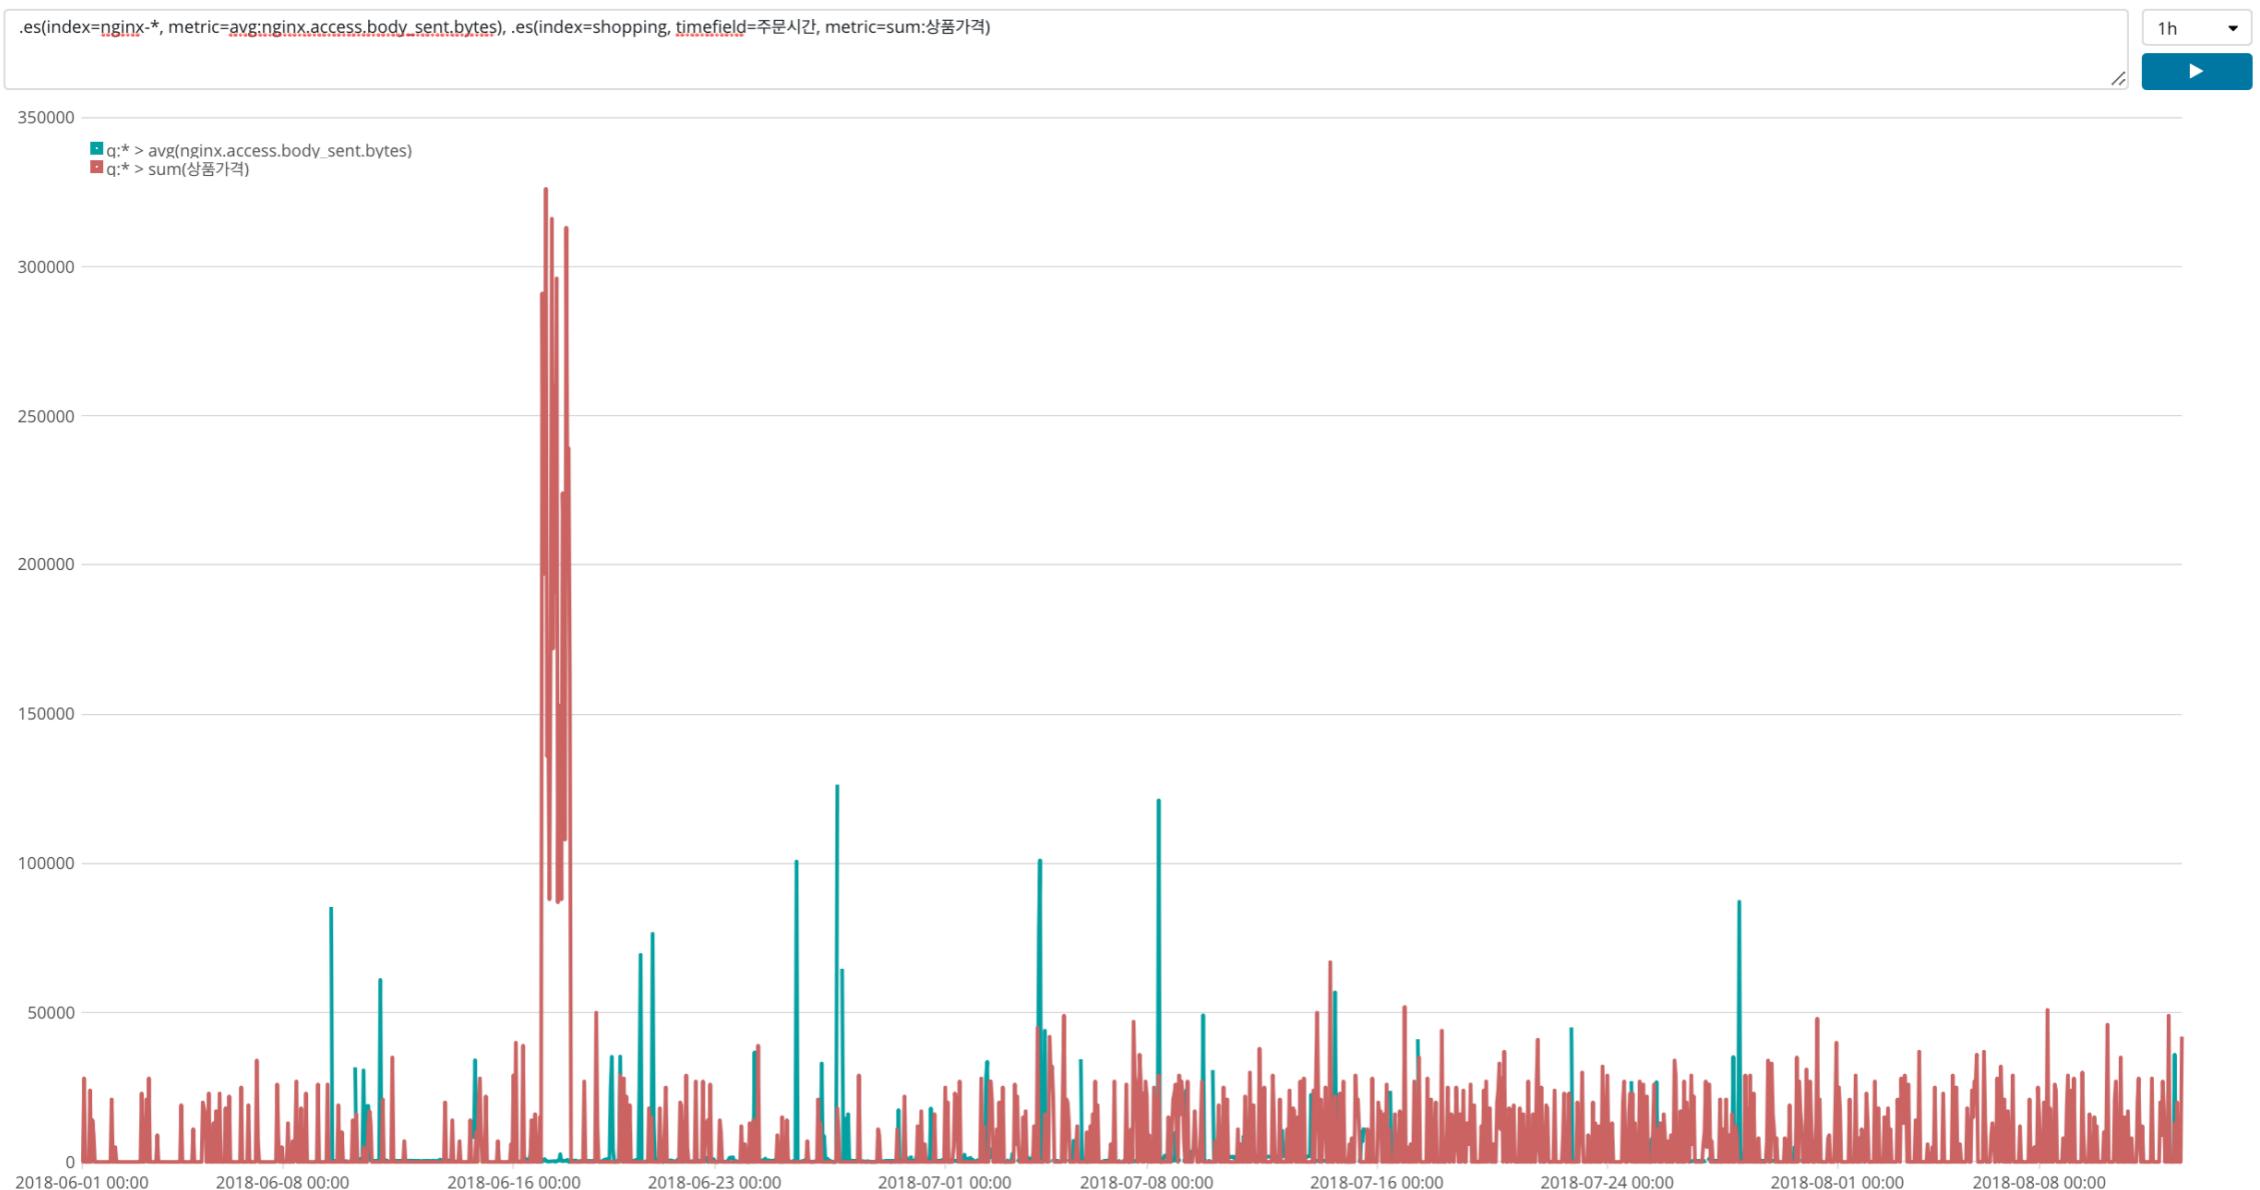

\* 문법 배울 예정

## Timelion - multiple timelion

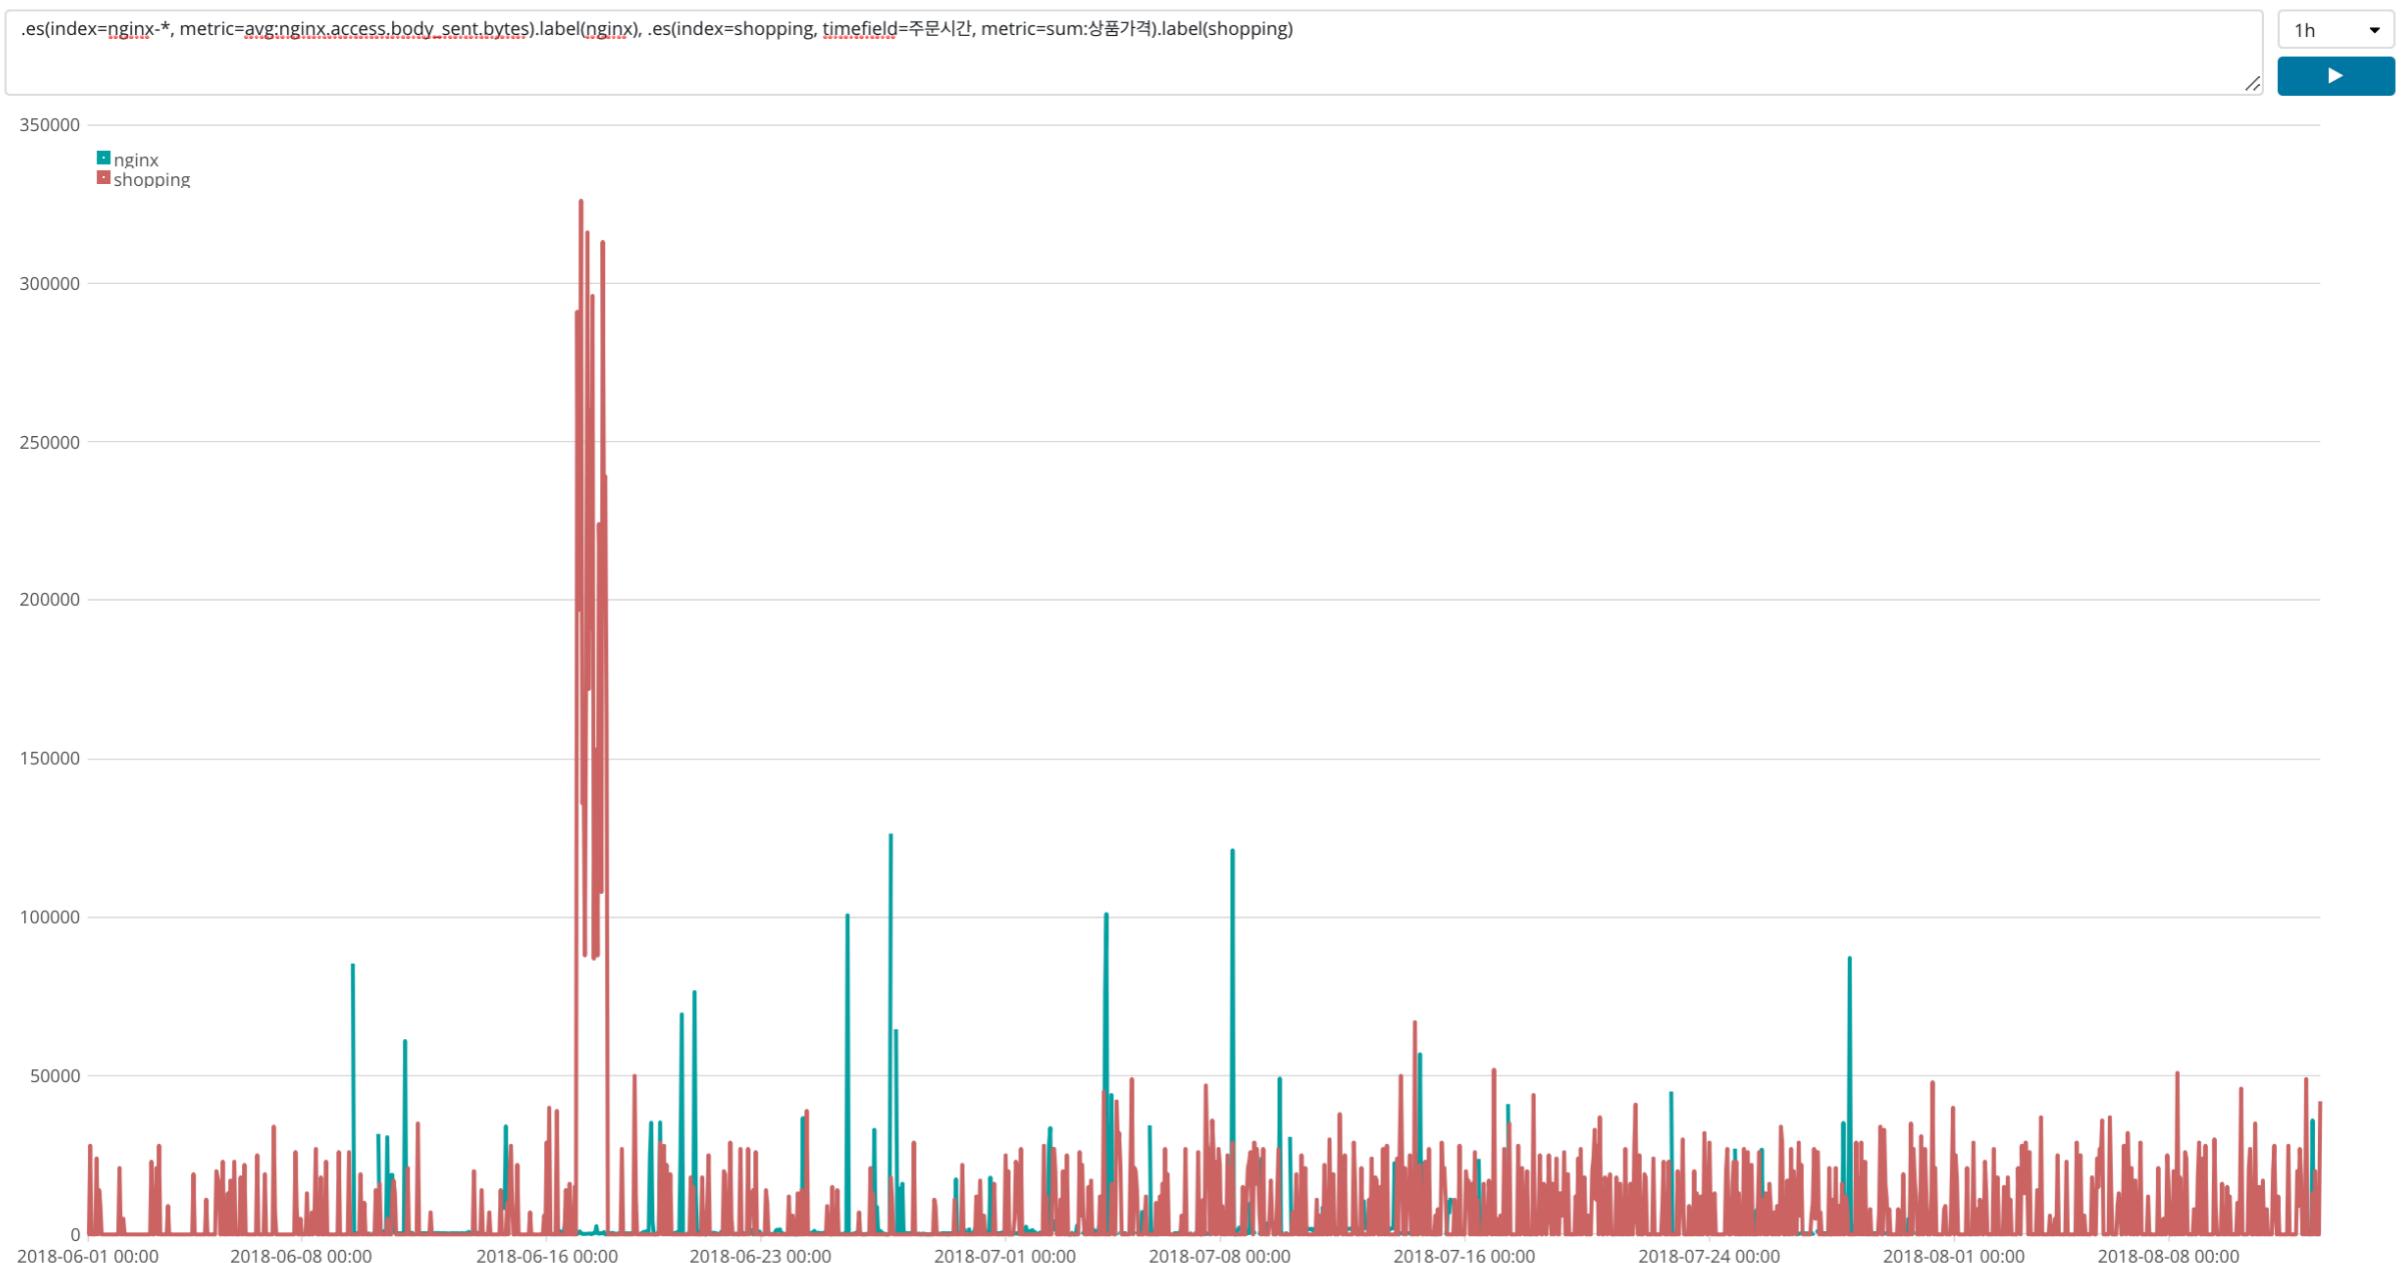

.es(index=nginx-\*, metric=avg:nginx.access.body\_sent.bytes) , .es(index=shopping, timefield=주문시간, metric=sum:상품가격)

\* nginx-\*과 shopping과 같이 전혀 연관 없어 보이는 index도 통합해서 시각화

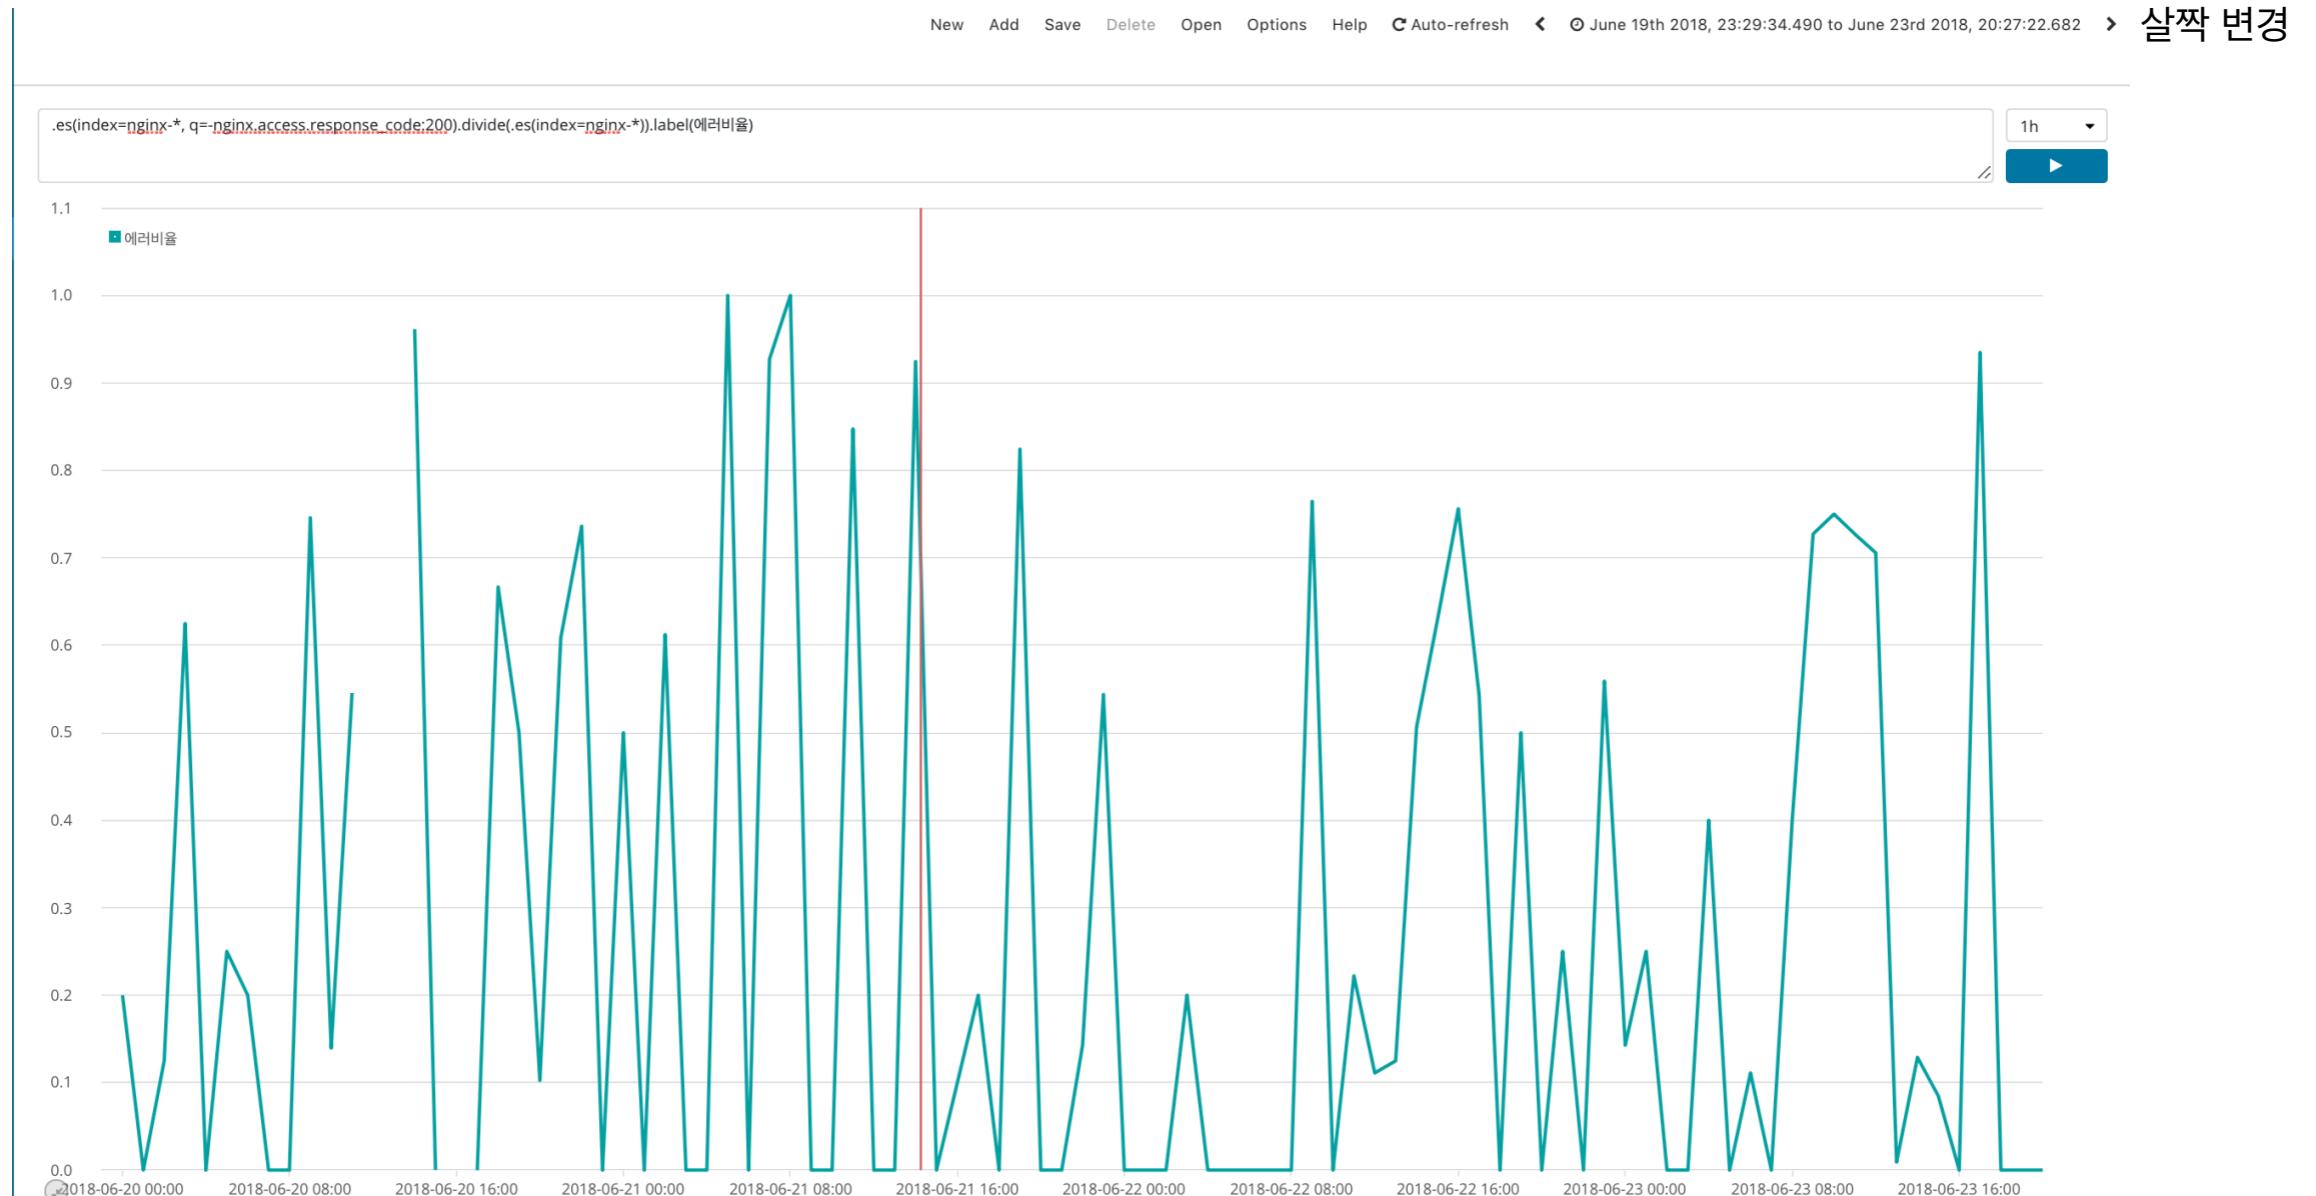

## Timelion - label

.es(index=nginx-\*, metric=avg:nginx.access.body\_sent.bytes).label(nginx) , .es(index=shopping, timefield=주문시간, metric=sum:상품가격).label(shopping)

## Timelion - divide

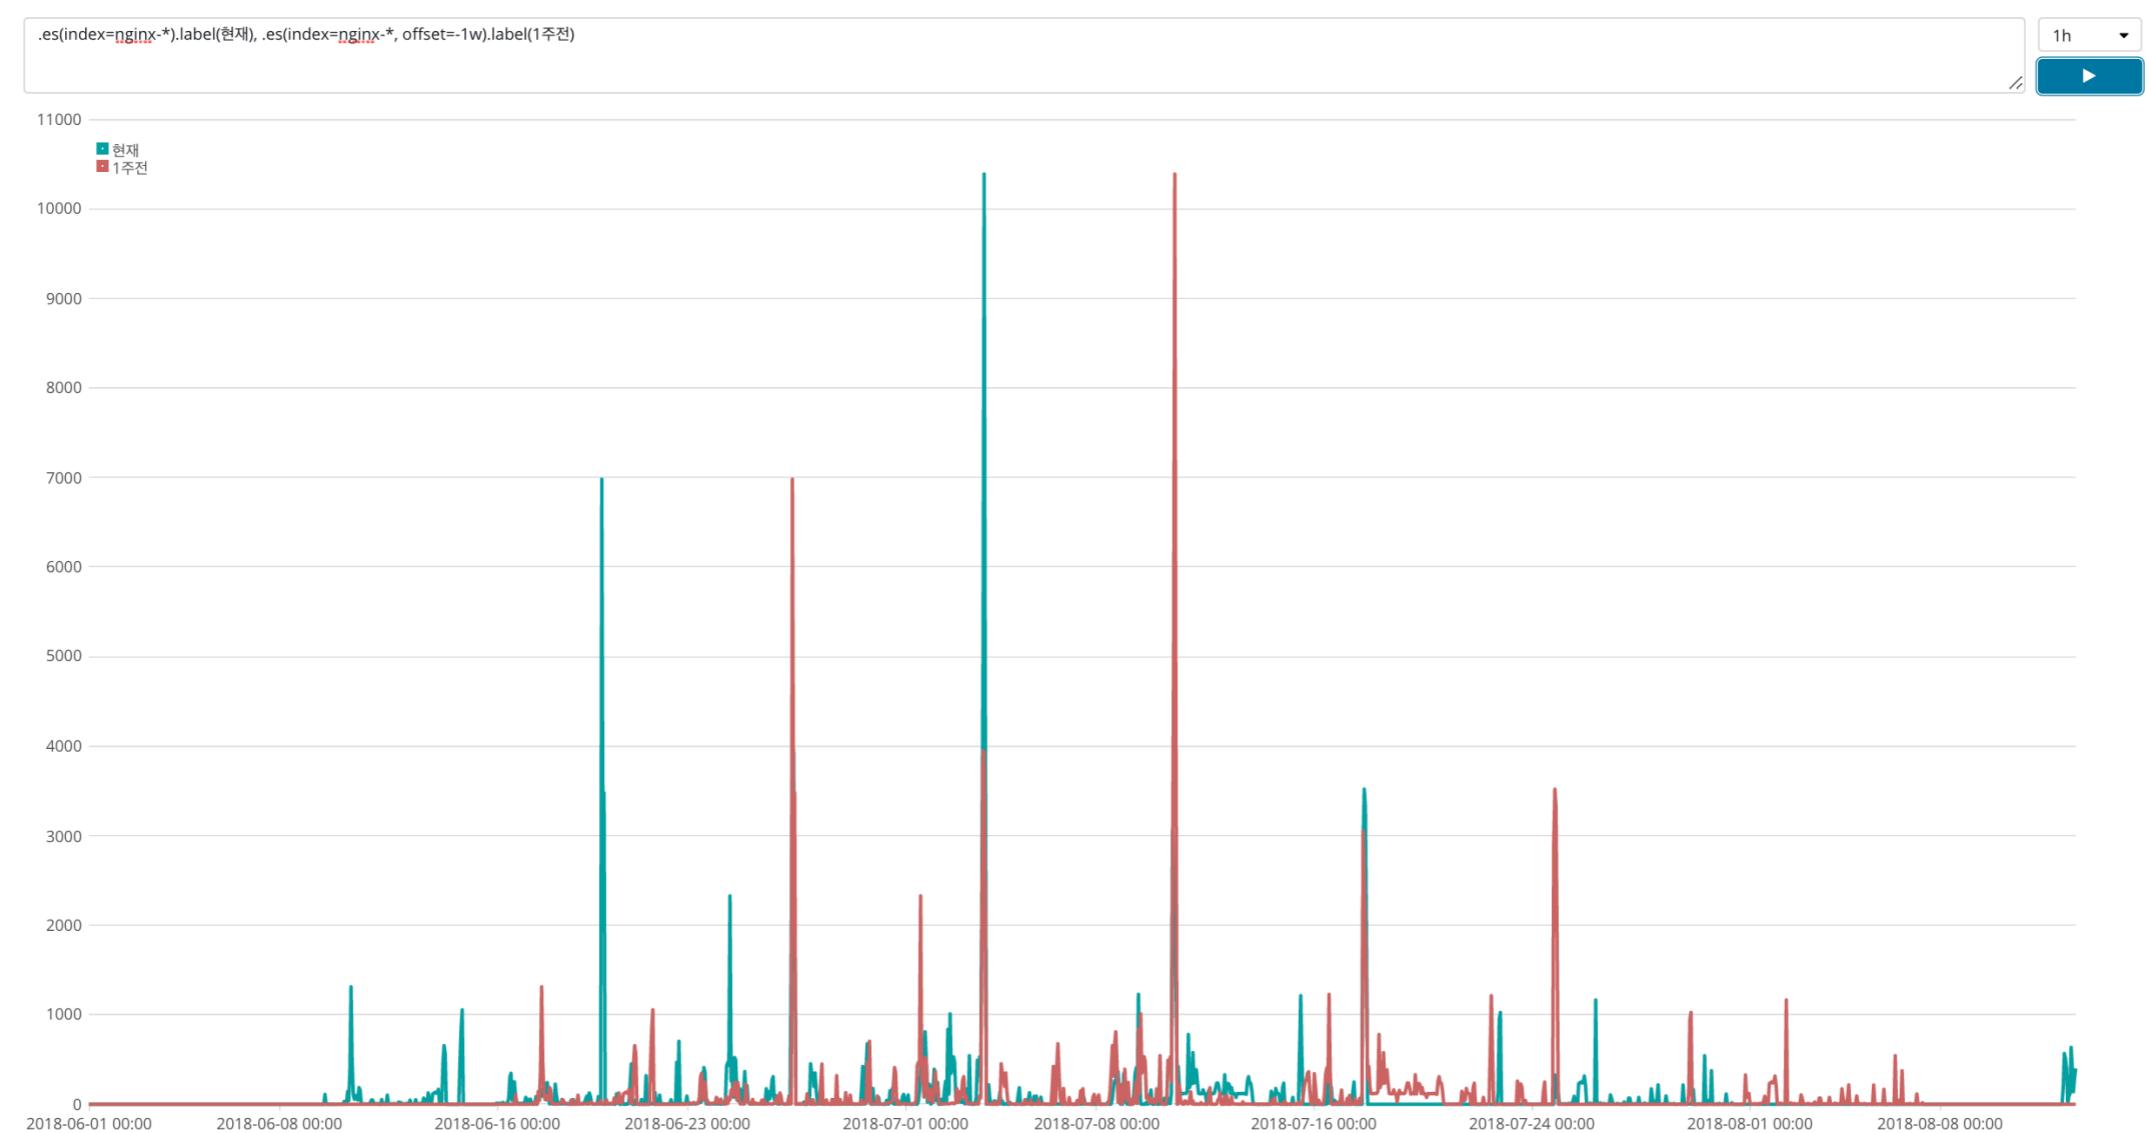

```
.es(index=nginx-*, q=-nginx.access.response_code:200) .divide( .es(index=nginx-*) ) .label(에러비율)
```

에러율의 추이를 확인할 수 있다

## Timelion - offset

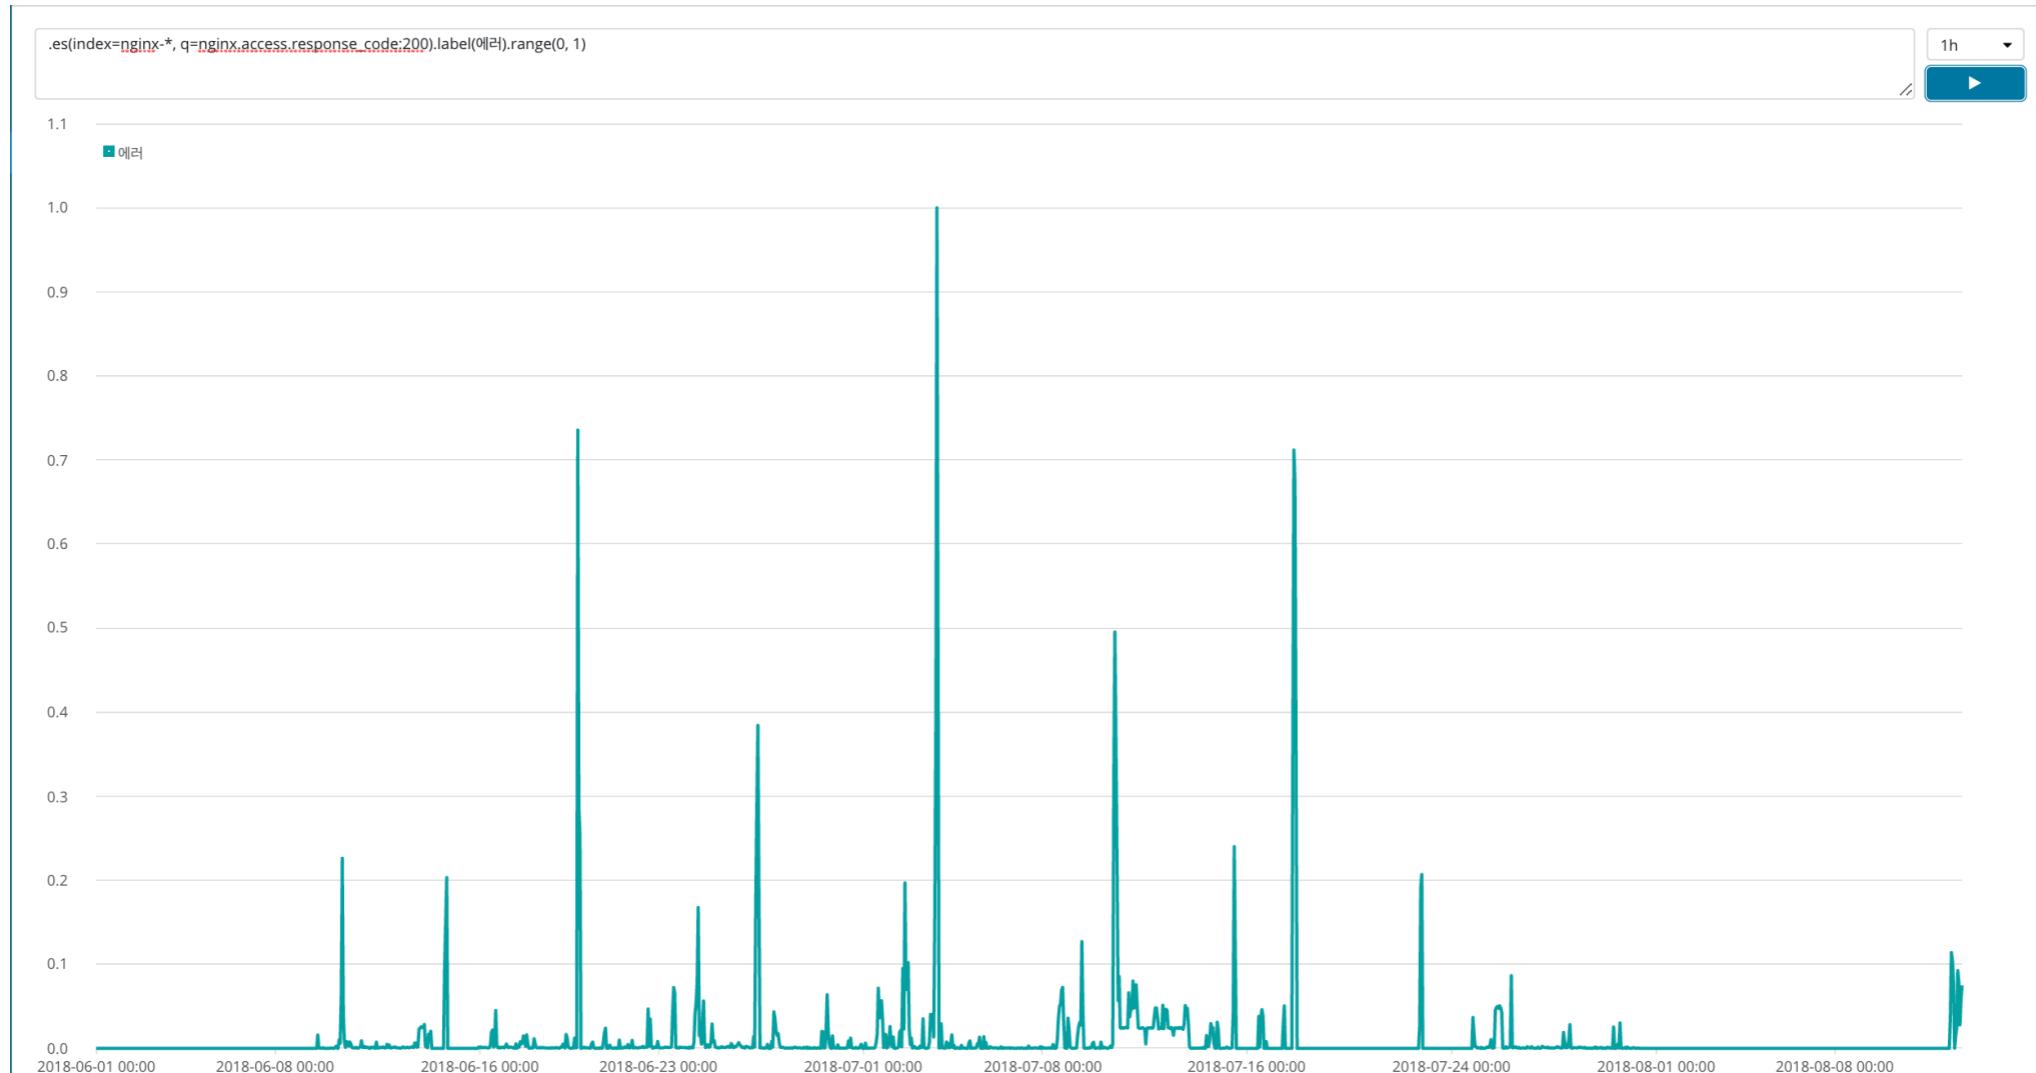

.es(index=nginx-\*).label(현재) , .es(index=nginx-\*, offset=-1w).label(1주전)

“현재 수치”와 “1주일 전 수치”를 동일 선에서 확인 가능

## Timelion - range

.es(index=nginx-\*, q=nginx.access.response\_code:200).label(에러).range(0, 1)

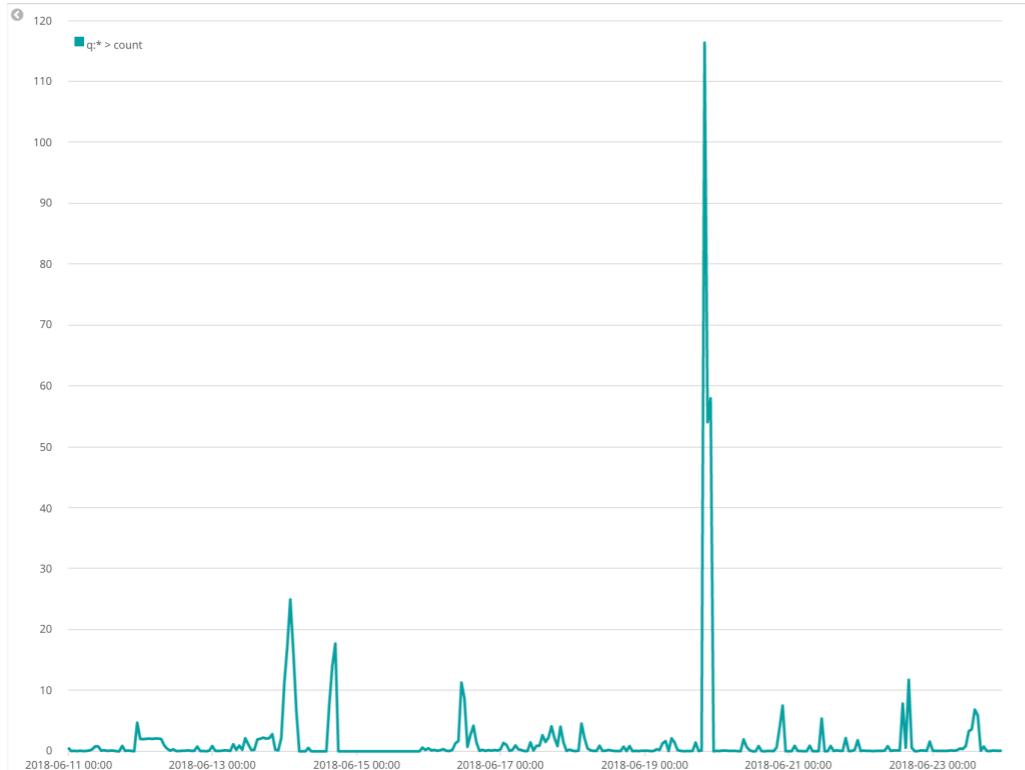

기간 내 에러 개수의 상대적 추이를 확인할 수 있다

**page 60 ~ 68 부분은 데이터 수집 문제로 2018년 6월 데이터를 사용합니다**

## Timelion - scale interval

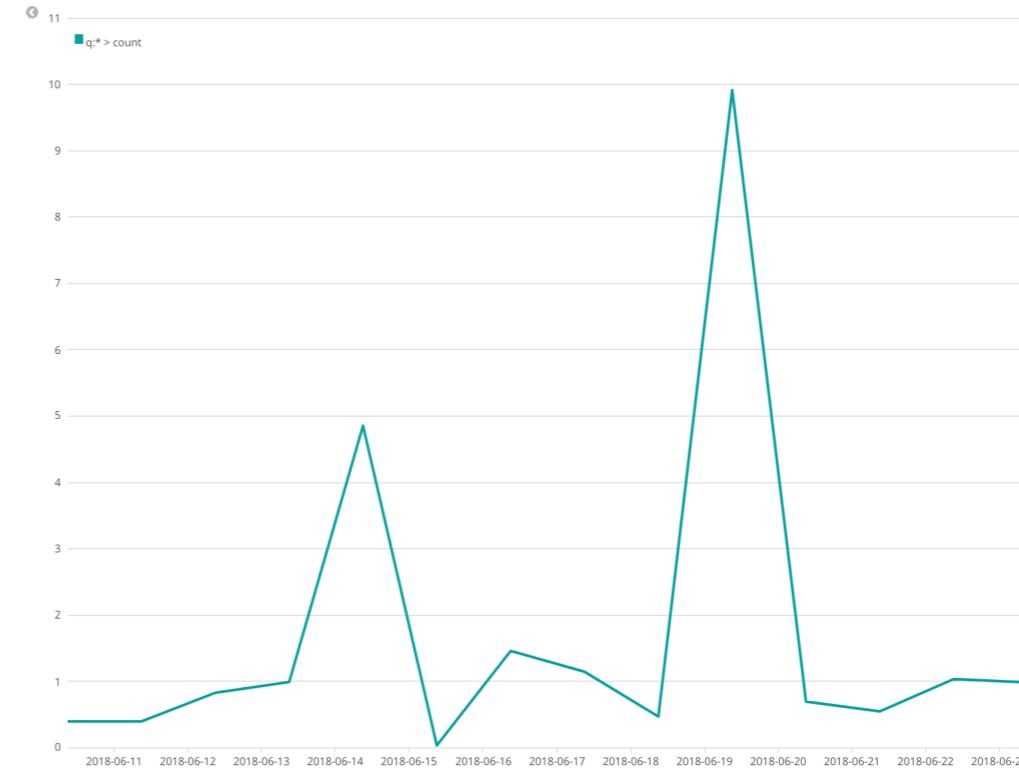

Interval : **1h**

Timelion : .es(index=nginx-\*).scale\_interval(1m)

Interval : **1d**

Timelion : .es(index=nginx-\*).scale\_interval(1m)

Interval이 다른 2개의 그래프에서 같은 시간 단위 동안의 접속수를 비교할 수 있다

## Timelion - scale interval

Interval : **1h**

Timelion : .es(index=nginx-\*).scale\_interval(1m)

Interval : **1d**

Timelion : .es(index=nginx-\*).scale\_interval(1m)

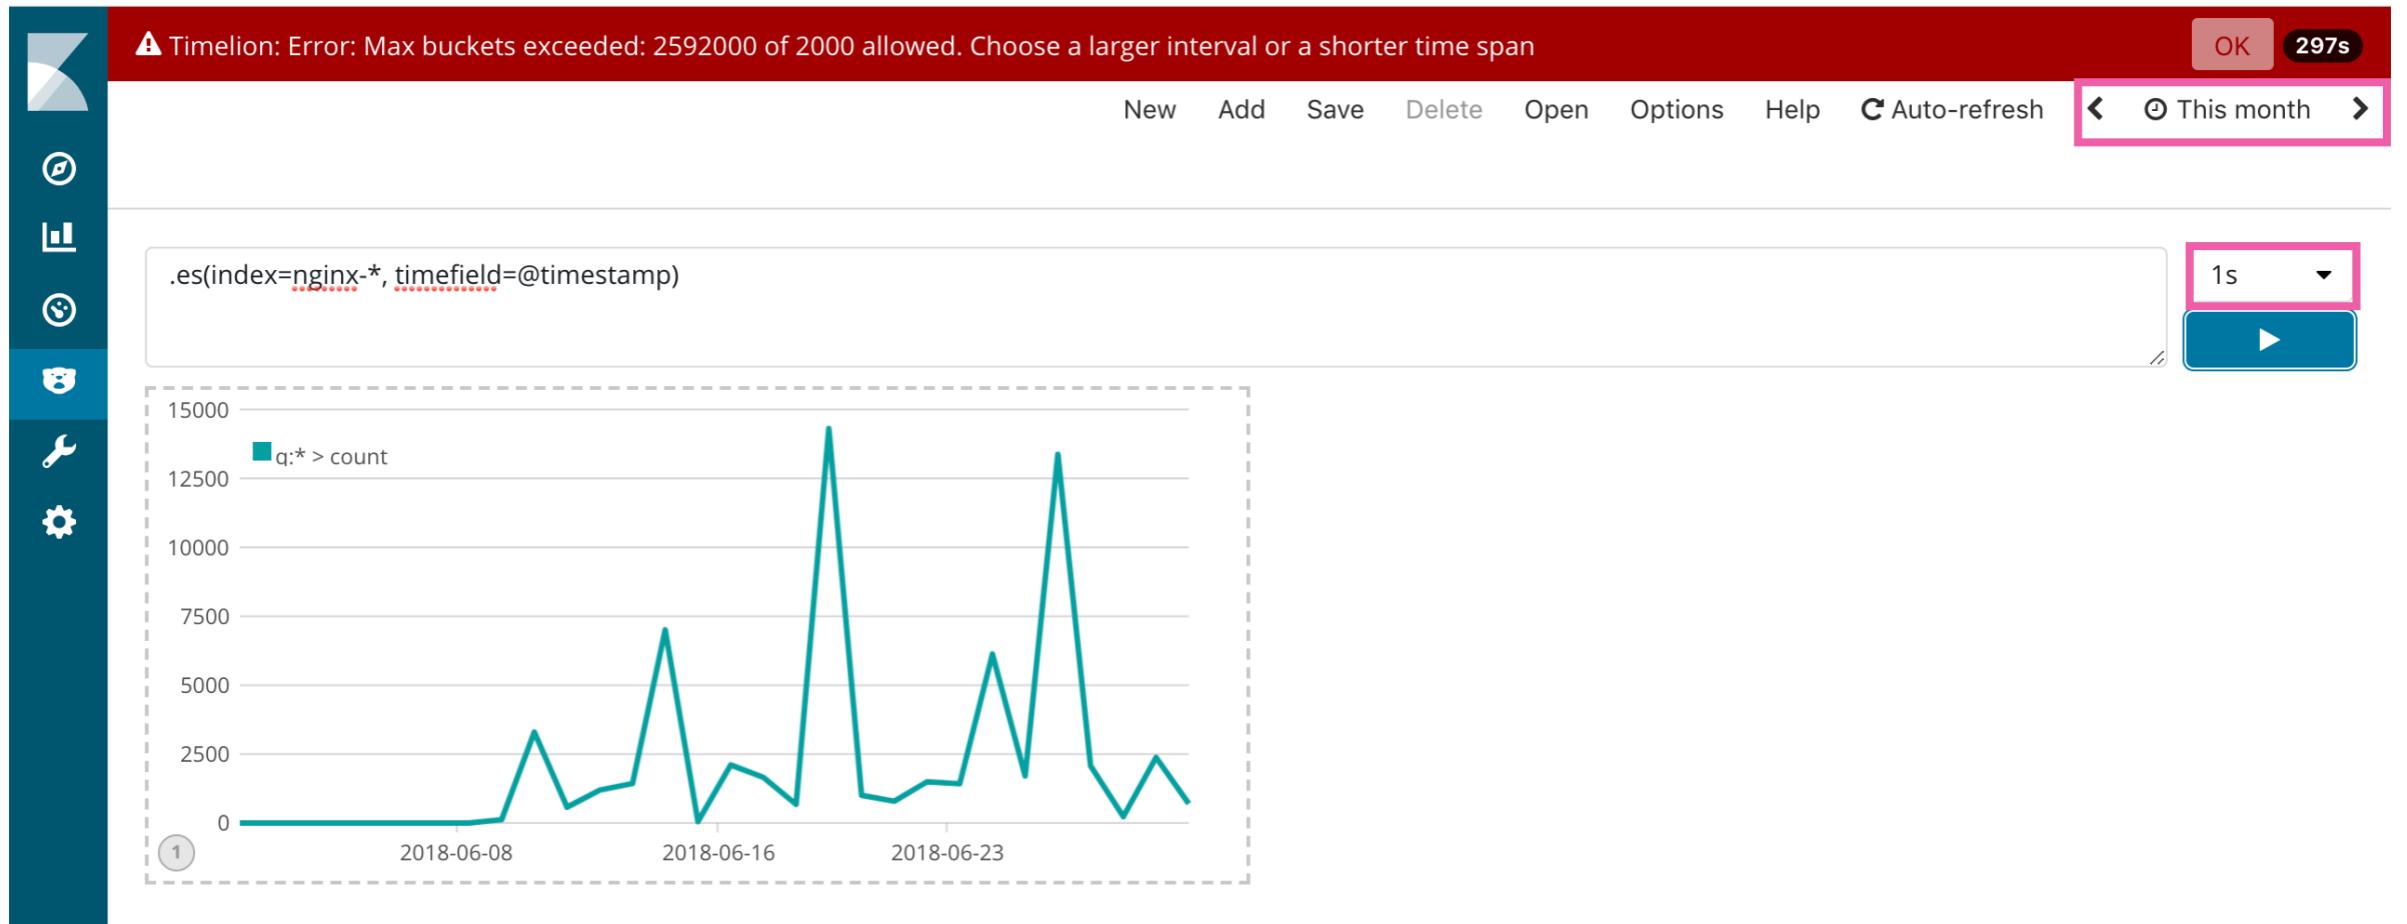

# 잠깐5, 이거 언제 쓰이지?

Interval이 다른 2개의 그래프에서 같은 시간 단위 동안의 접속수를 비교할 수 있다

## Dashboard에서 사용하는 Timelion은 보통 Interval을 Auto로 한다

심화

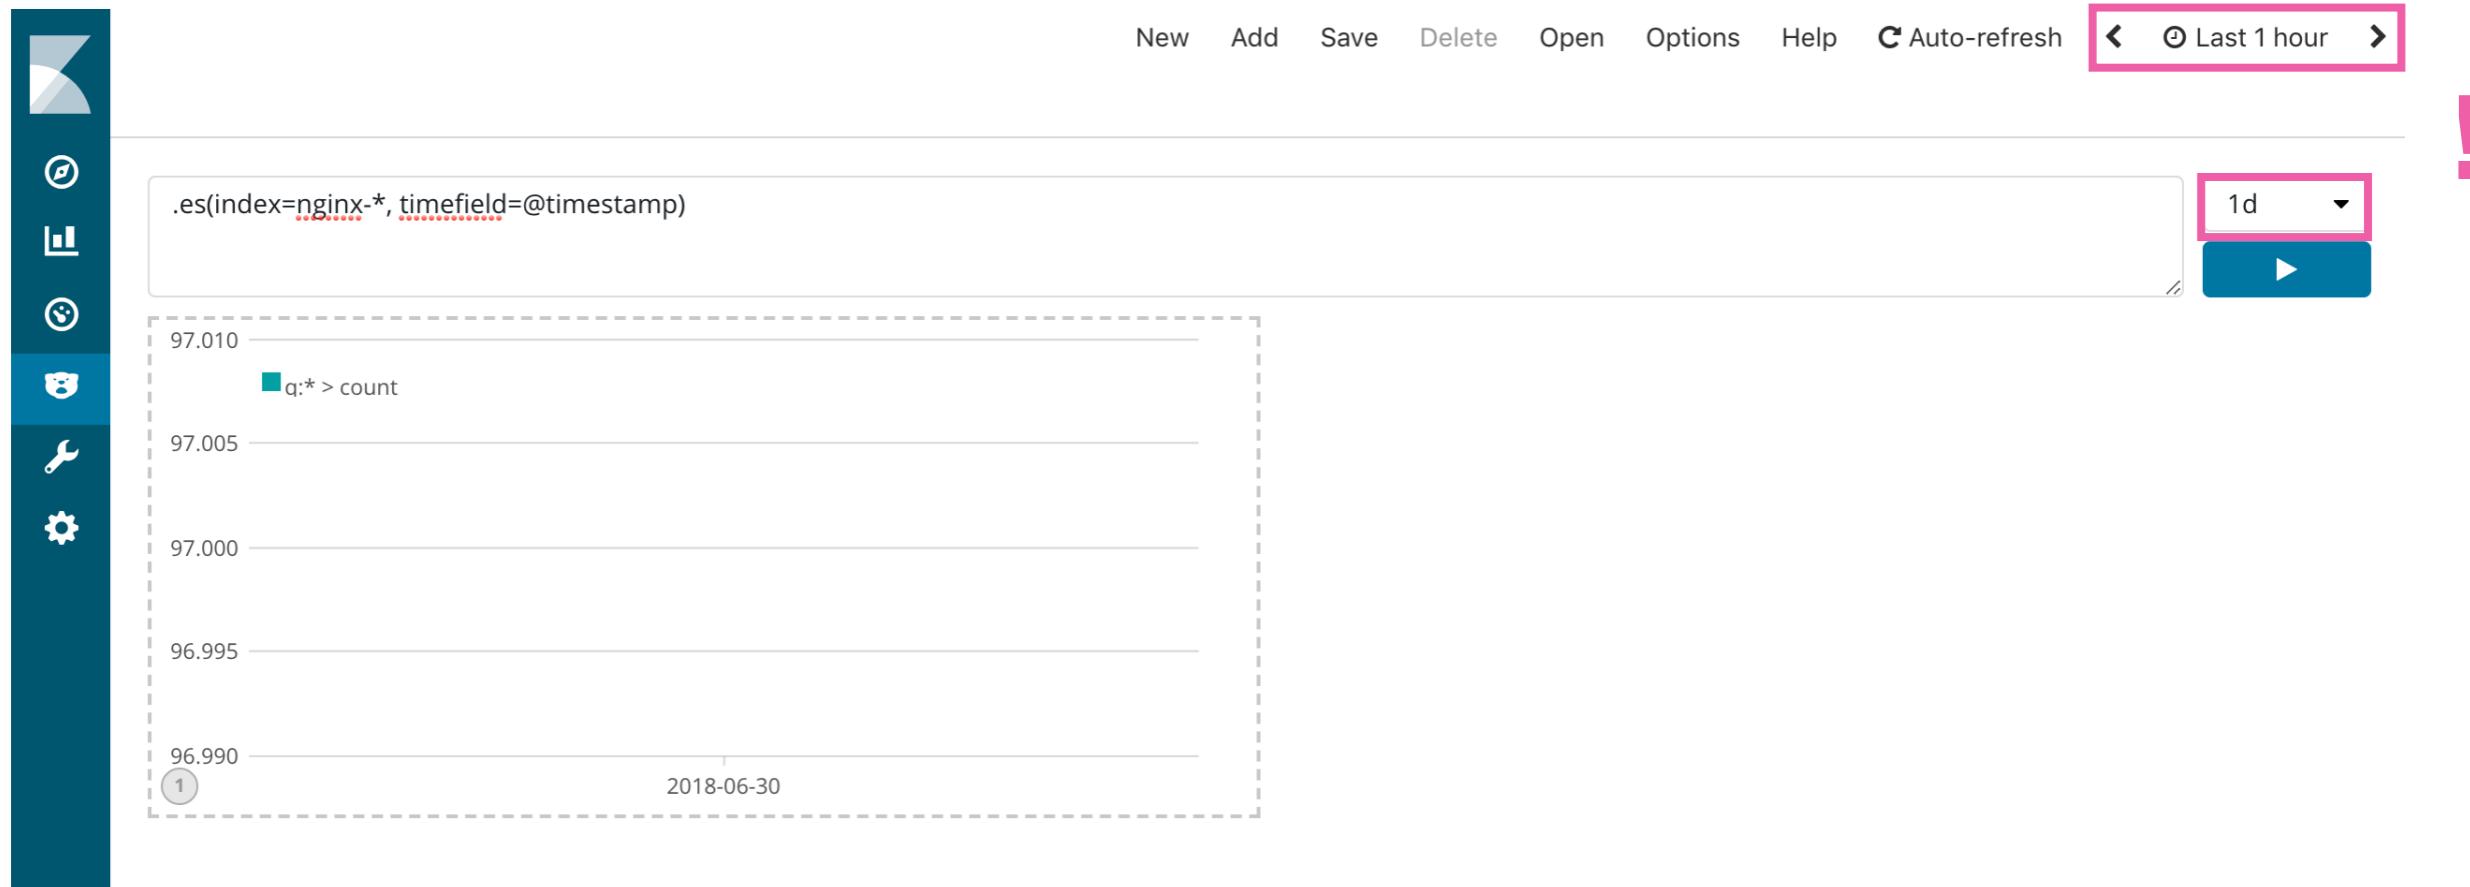

Time Picker 기간 대비 Interval을 너무 작게 설정하면

**Max buckets exceeded error**

Dashboard에서 사용하는 Timelion은 보통 Interval을 Auto로 한다

심화

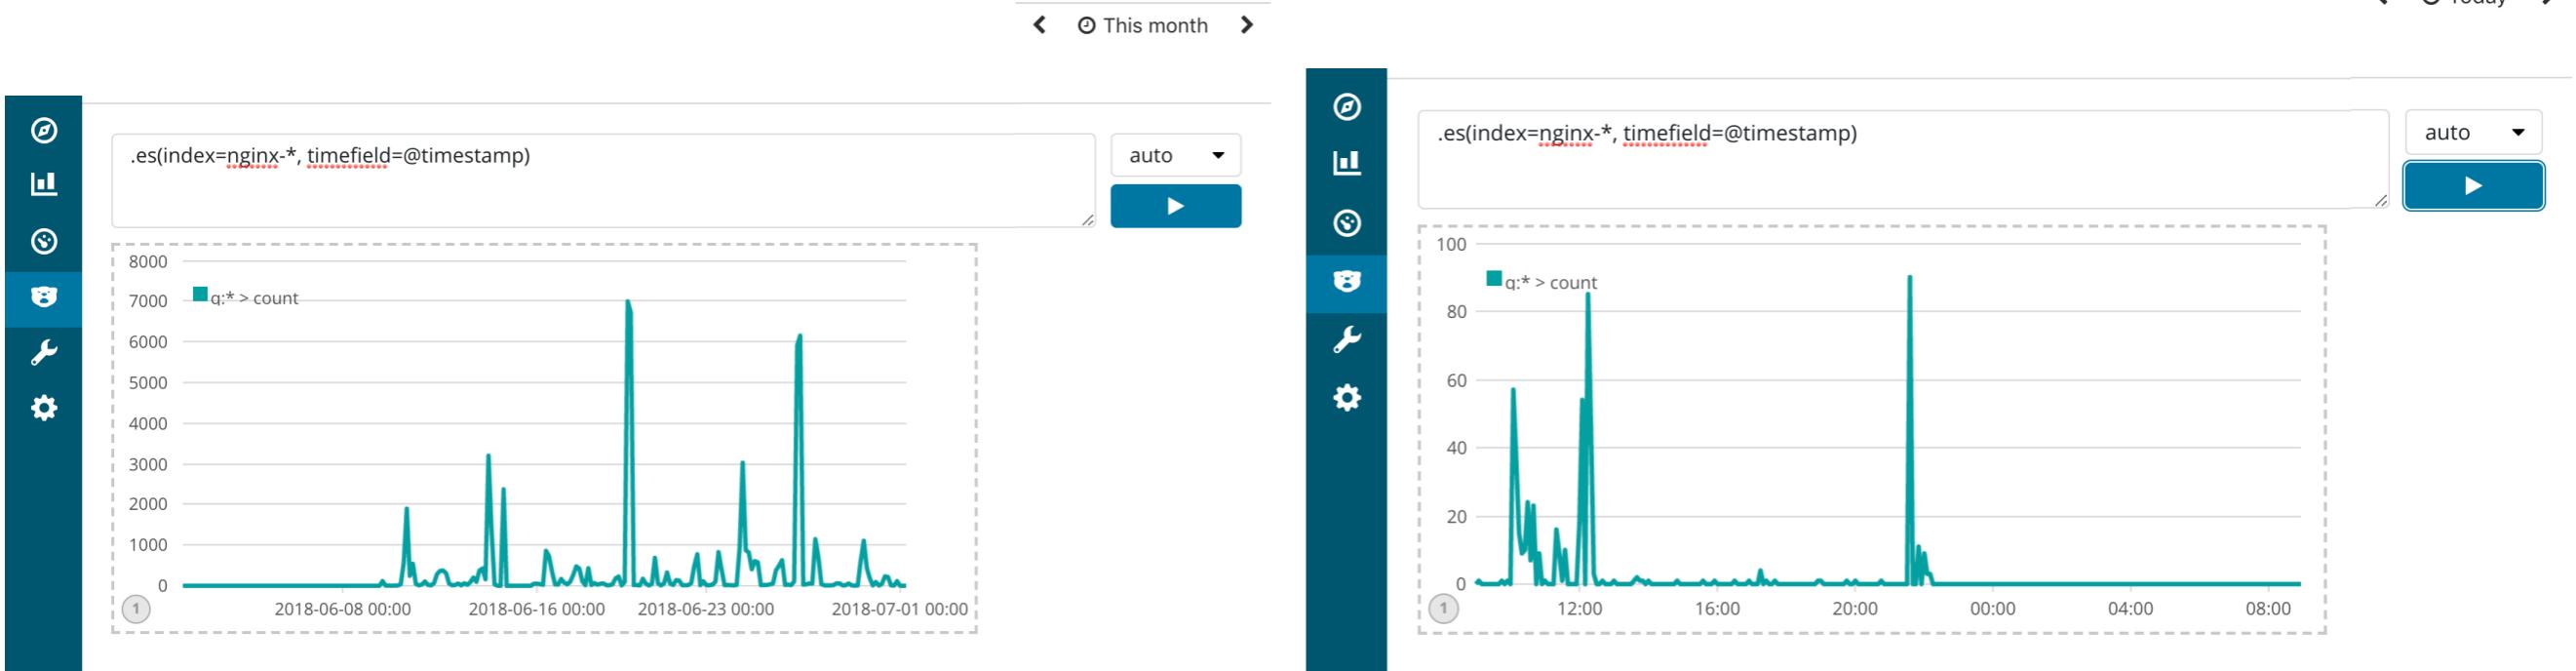

Time Picker 기간 대비 Interval을 너무 크게 설정하면

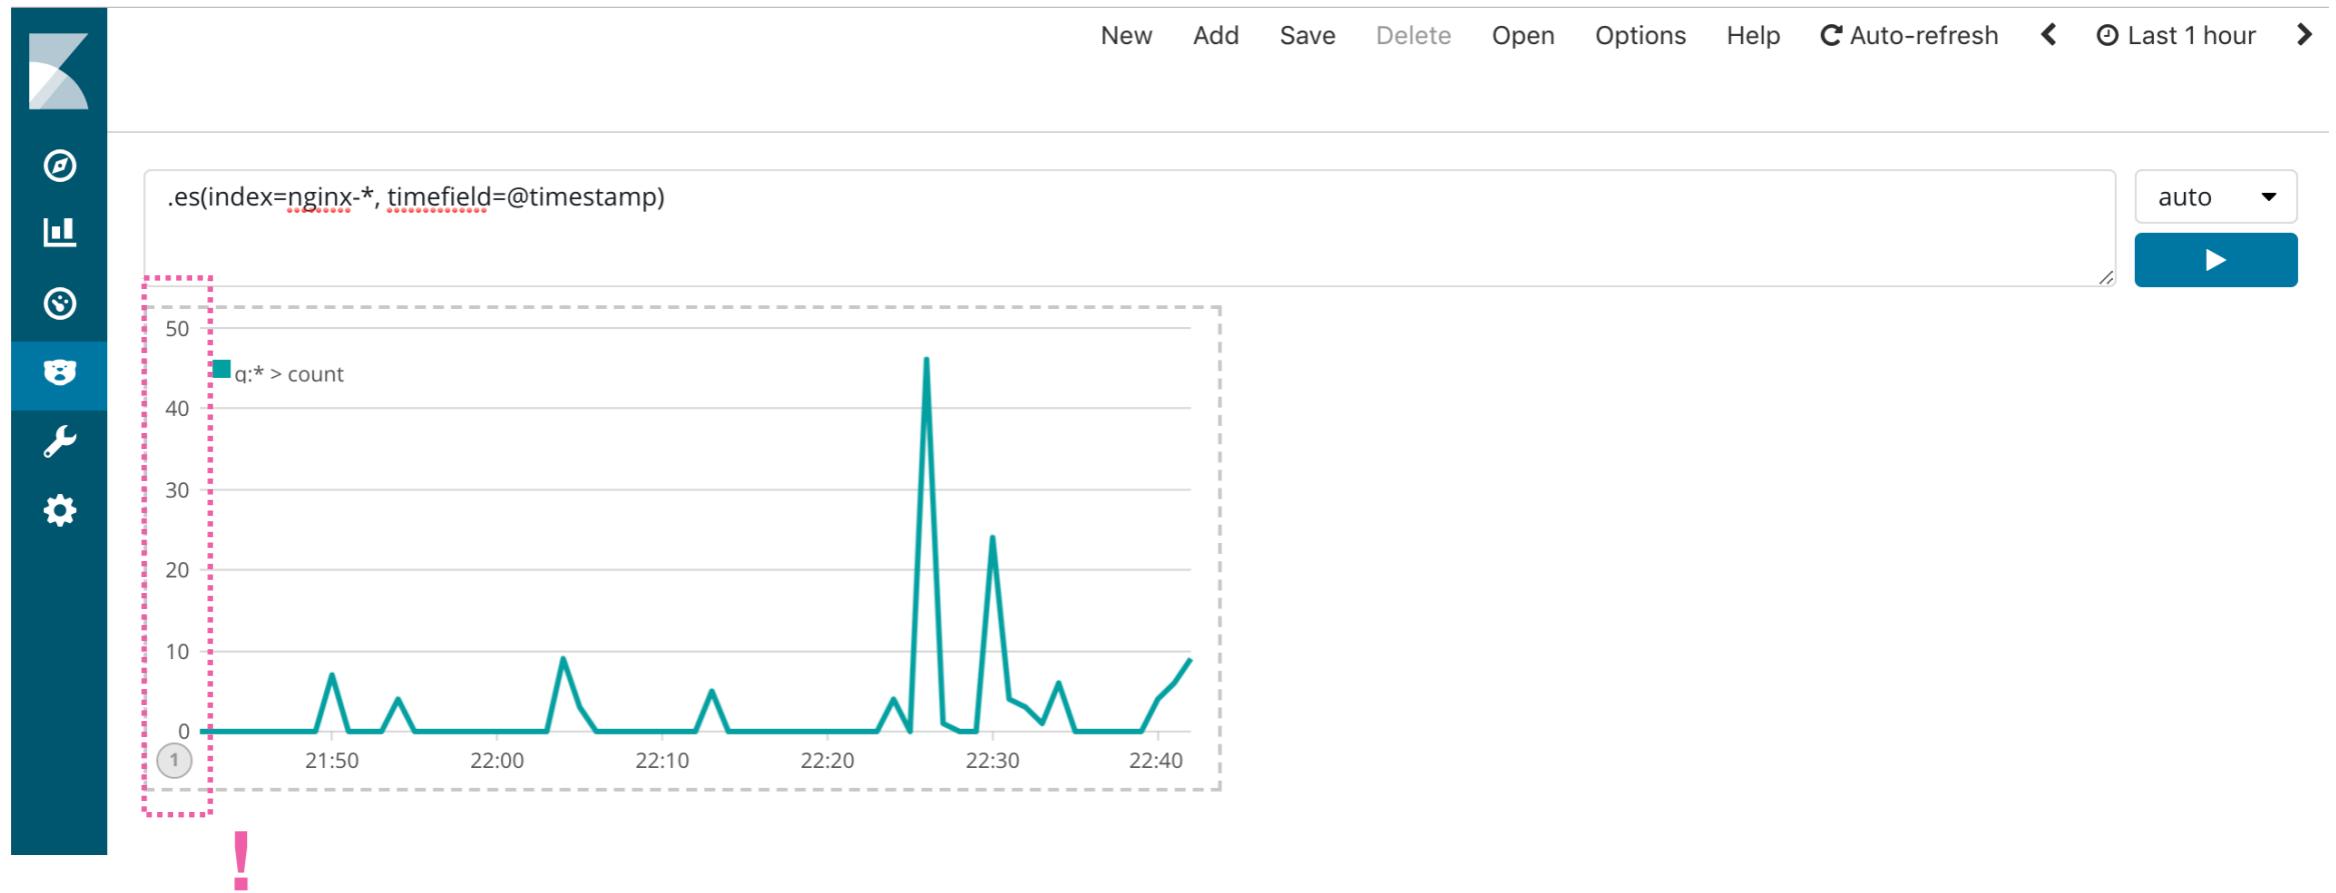

유의미한 결과를 볼 수 없다

Interval을 Auto로 하면 Time Picker 기간에 맞게 유연하게 Interval 설정 가능

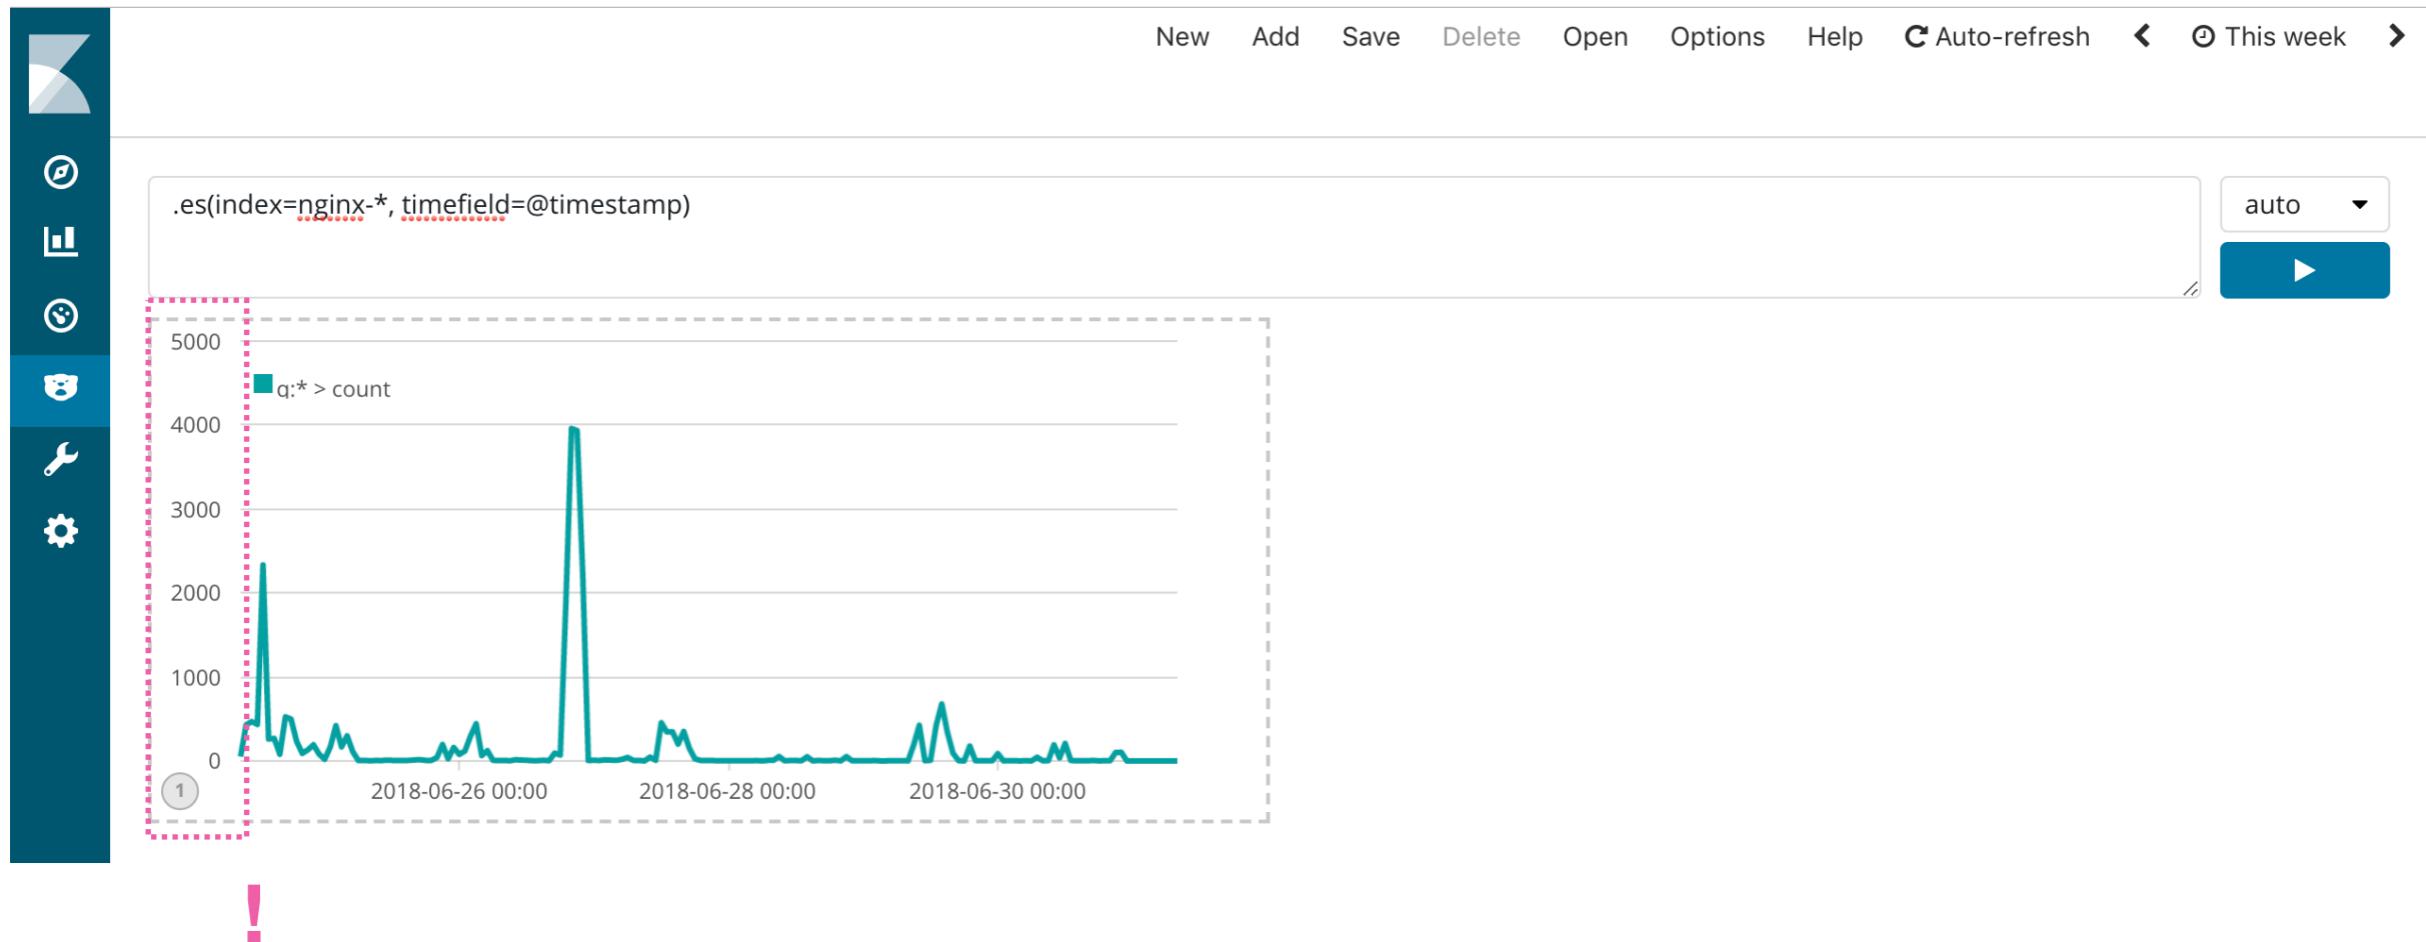

심화

Time Range를 **This month**로 하면 Interval이 커지고, **Today**로 하면 Interval이 작아진다

분당(1 minute) document count를 모니터링 있다고 하자

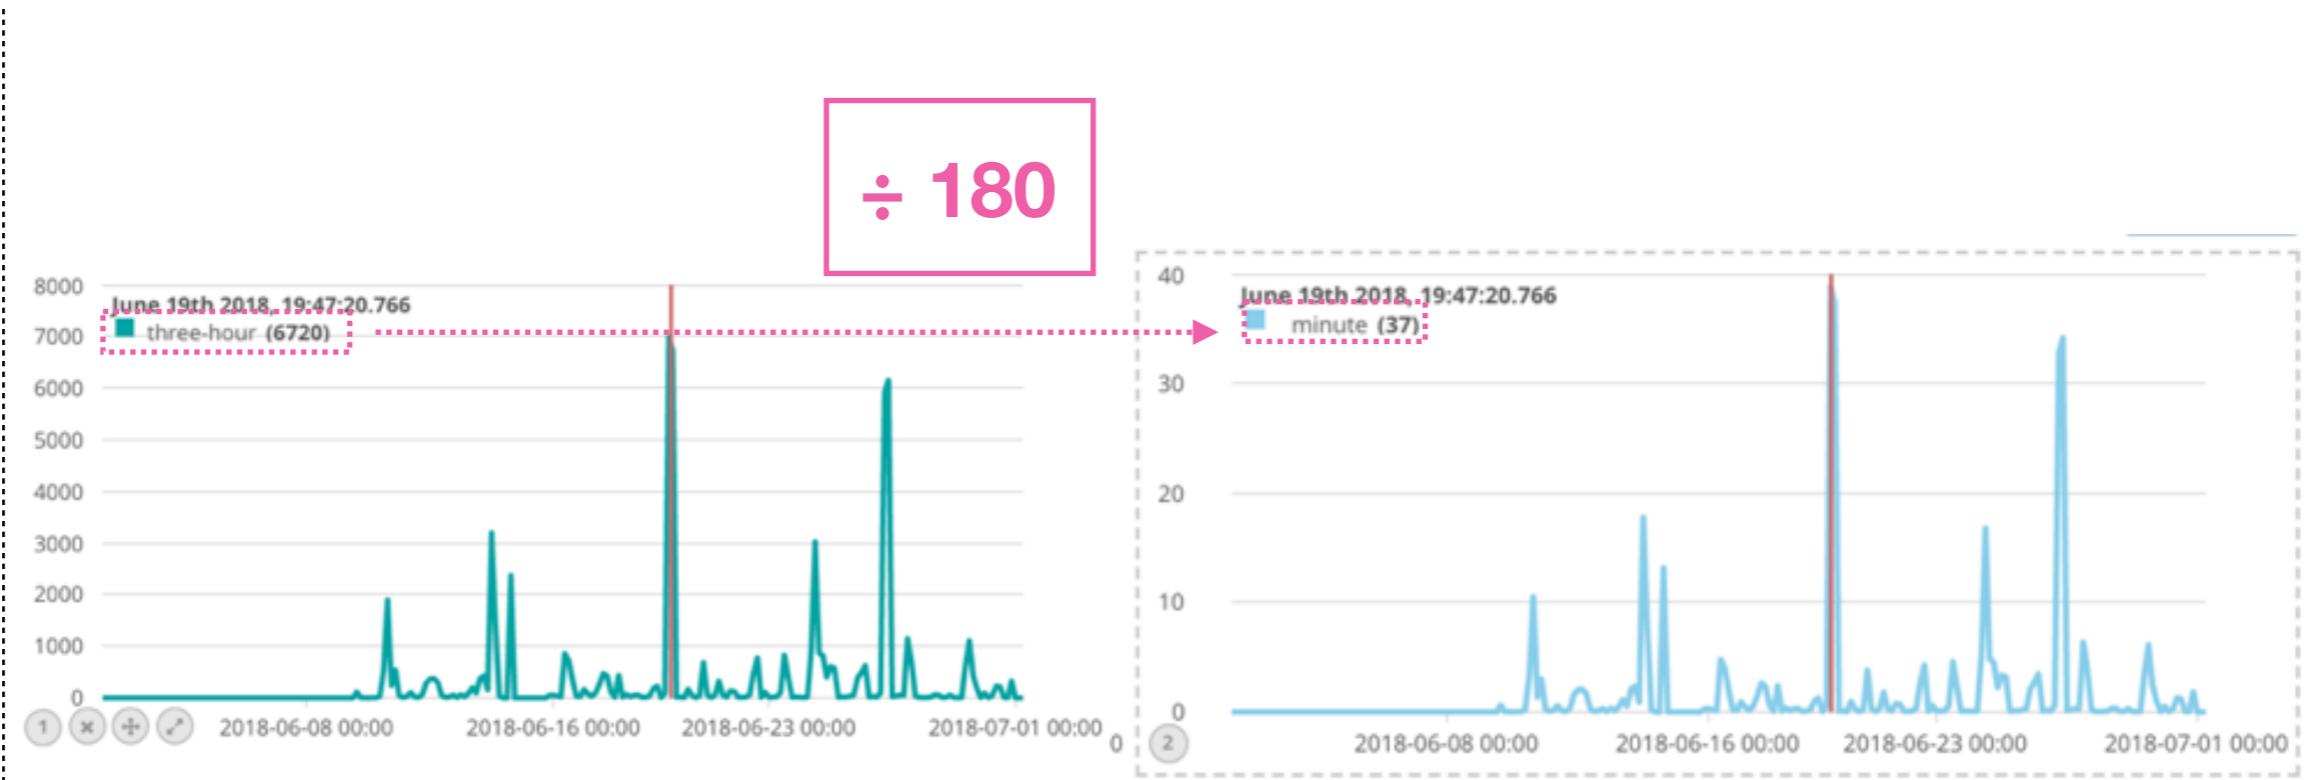

이 때 Time Range를 넓히면 Interval도 (auto이지만 실제로) **hour, day**로 커지고 표시되는 결과도 바뀐다

- document count per hour
- document count per day  **≠ document count per minute**

즉, Time Range를 길게하면서도 Interval은 작게 유지하려 했는데  
Time Range를 크게 한만큼 Interval도 커지는 결과 발생

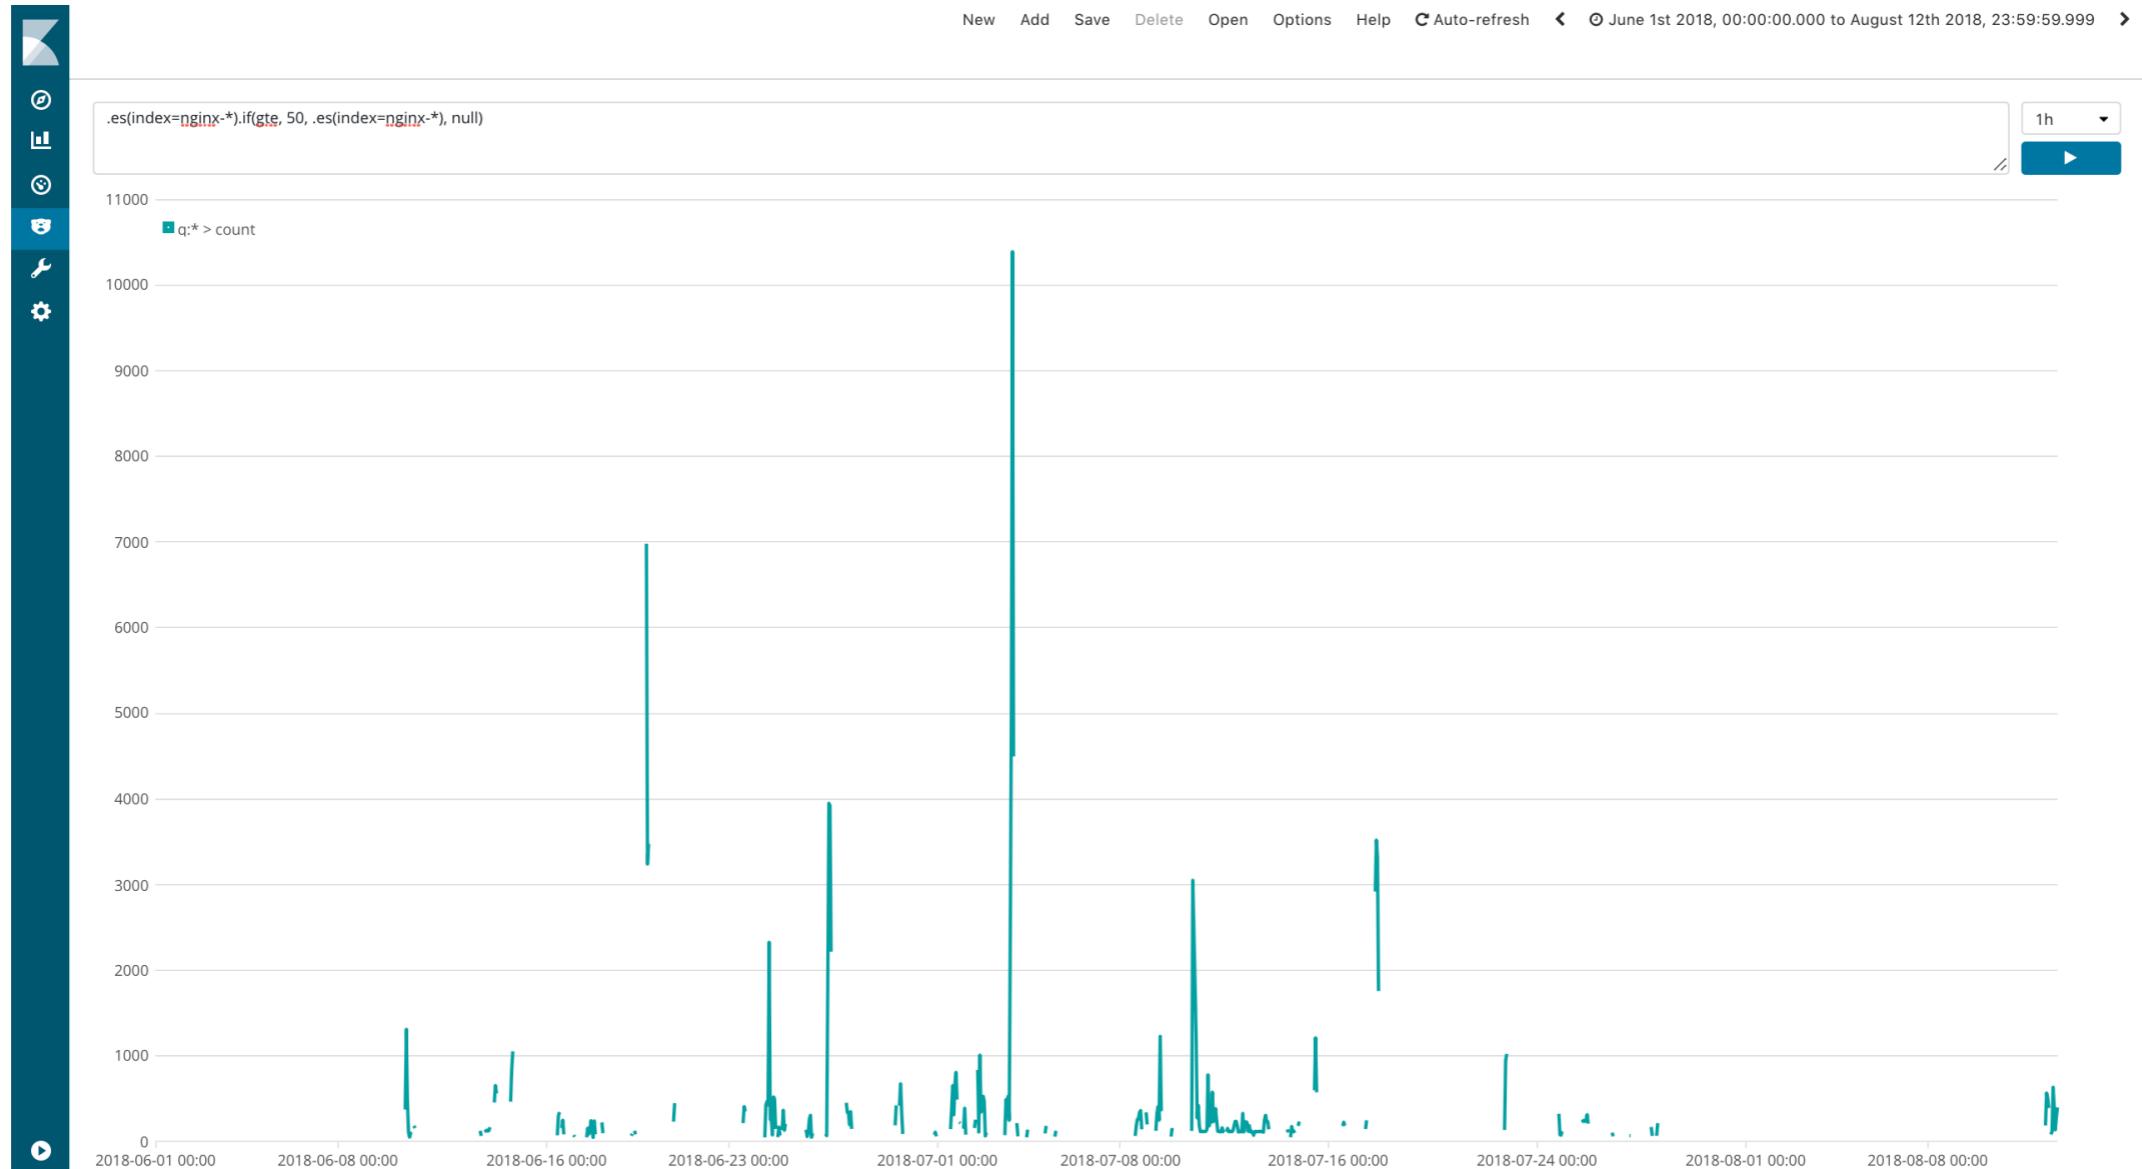

↓  
Interval이 바뀌어도 scale은 일정하게 유지할 수 없을까?

Interval이 변경되어도 Time Range가 15분이든, today든 this year든  
scale을 유지하여 **분당 document count 결과**를 볼 수 없을까?

## Timelion - if

```
.es(index=nginx-*).if( gte, 50, .es(index=nginx-*), null )
```

조건에 따른 다른 값 시각화 (문법 )

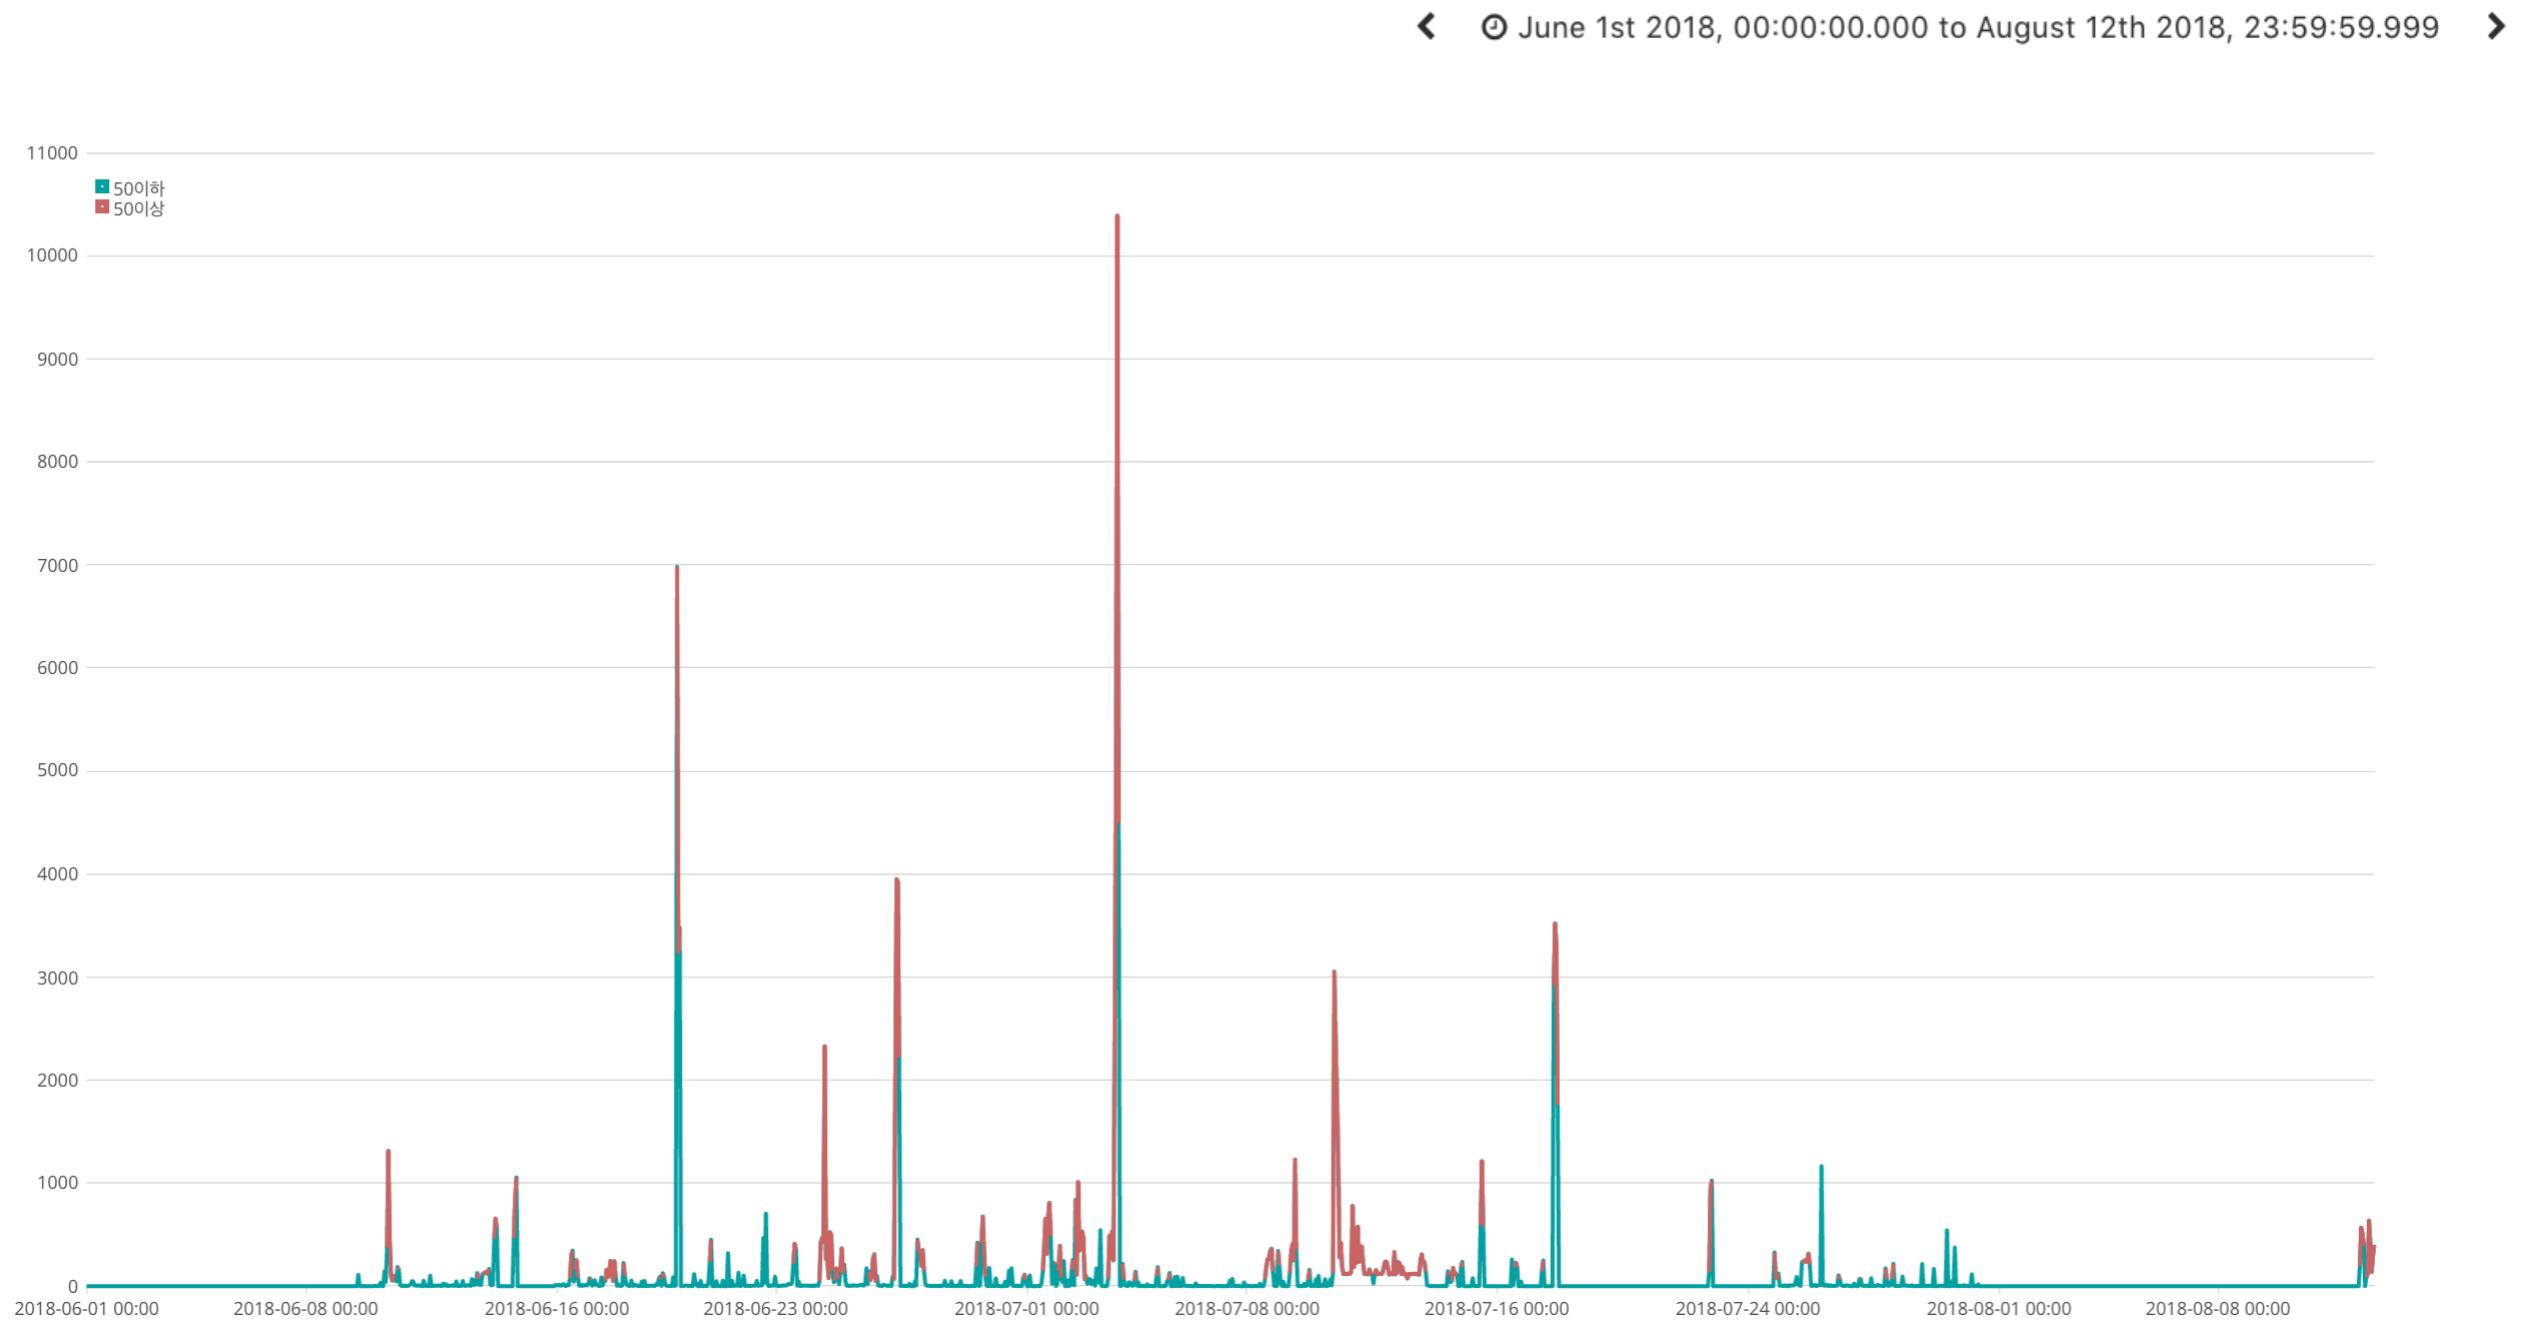

이 정도가 Timelion의 기본문법이며, 나머지는 를 참고해서 한 번씩 입력해보자. (수업 후에)

그리고, 다음 페이지에 나오는 몇 가지 예시를 보면서 Timelion을 마무리 하자.

이 때, Timelion 기능을 자신의 문제에 어떻게 응용/적용할 수 있을지 생각해보자.

## 예제 15) Timelion

nginx-\* index의 시간당(1h) 접속수가 50 이상인 구간과 50 이하인 구간을 다르게 표시하자

기본적인 시각화는 다 배웠다.

남겨둔 Aggregation을 마저 배우고

Kibana에서 제공하는 chart/aggregation을 다 쓸 수 있도록 하자

Aggregation - Pipeline

Kibana에서 사용할 수 있는 Aggregation

= ~~Bucket + Metrics + Pipeline~~

(... 지난 주에 배웠고)

# Pipeline Aggregation

## Pipeline Aggregations

### ① 특징

Pipeline aggregations work on the outputs produced from other aggregations rather than from document sets, adding information to the output tree. There are many different types of pipeline aggregation, each computing different information from other aggregations, but these types can be broken down into two families:

#### *Parent*

#### ② 종류

A family of pipeline aggregations that is provided with the output of its parent aggregation and is able to compute new buckets or new aggregations to add to existing buckets.

#### *Sibling*

Pipeline aggregations that are provided with the output of a sibling aggregation and are able to compute a new aggregation which will be at the same level as the sibling aggregation.

Aggregation - Parent Pipeline

종류	상세
Derivative	Bucket Agg 후, Bucket 별 Metric Agg 하고 난 후, 연속한 Bucket 간의 차이를 구함
Cumulative Sum	Bucket Agg 후, Bucket 별 Metric Agg 하고 난 후, Bucket 값들의 누적합을 구함
Moving Average	Bucket Agg 후, Bucket 별 Metric Agg 하고 난 후, {n개} Bucket 간의 평균을 구함
Serial Differencing	Bucket Agg 후, Bucket 별 Metric Agg 하고 난 후, {n번째 이전} Bucket 과의 차이를 구함
(Date Histogram 또는 Histogram 만 지원)	
Buckets	<div style="display: flex; align-items: center;"> <span style="margin-right: 10px;"><input type="button" value="▼"/></span> <span>Split Rows</span> <span style="margin-left: 20px;"><input checked="" type="checkbox"/> <input type="checkbox"/></span> </div>
Last bucket aggregation must be "Date Histogram" or "Histogram" when using "Cumulative Sum" metric aggregation!

## Data Table Configuration

The screenshot shows the configuration interface for a data table named "shopping". The interface is divided into three main sections: Metrics, Aggregation, and Buckets.

**Metrics** section:

- Metric:** Sum
- Field:** 상품가격
- Custom Label:** 매출

**Aggregation** section (highlighted with a blue dashed box):

- Metric:** Derivative
- Metric:** metric: 매출
- Custom Label:** 매출 증감

**Buckets** section:

- Split Rows:** Date Histogram
- Field:** 주문시간
- Interval:** Daily
- Custom Label:** 날짜

## Data Table Object

The diagram illustrates the calculation of total sales from daily sales data. It shows two tables: one for daily sales and one for cumulative total sales.

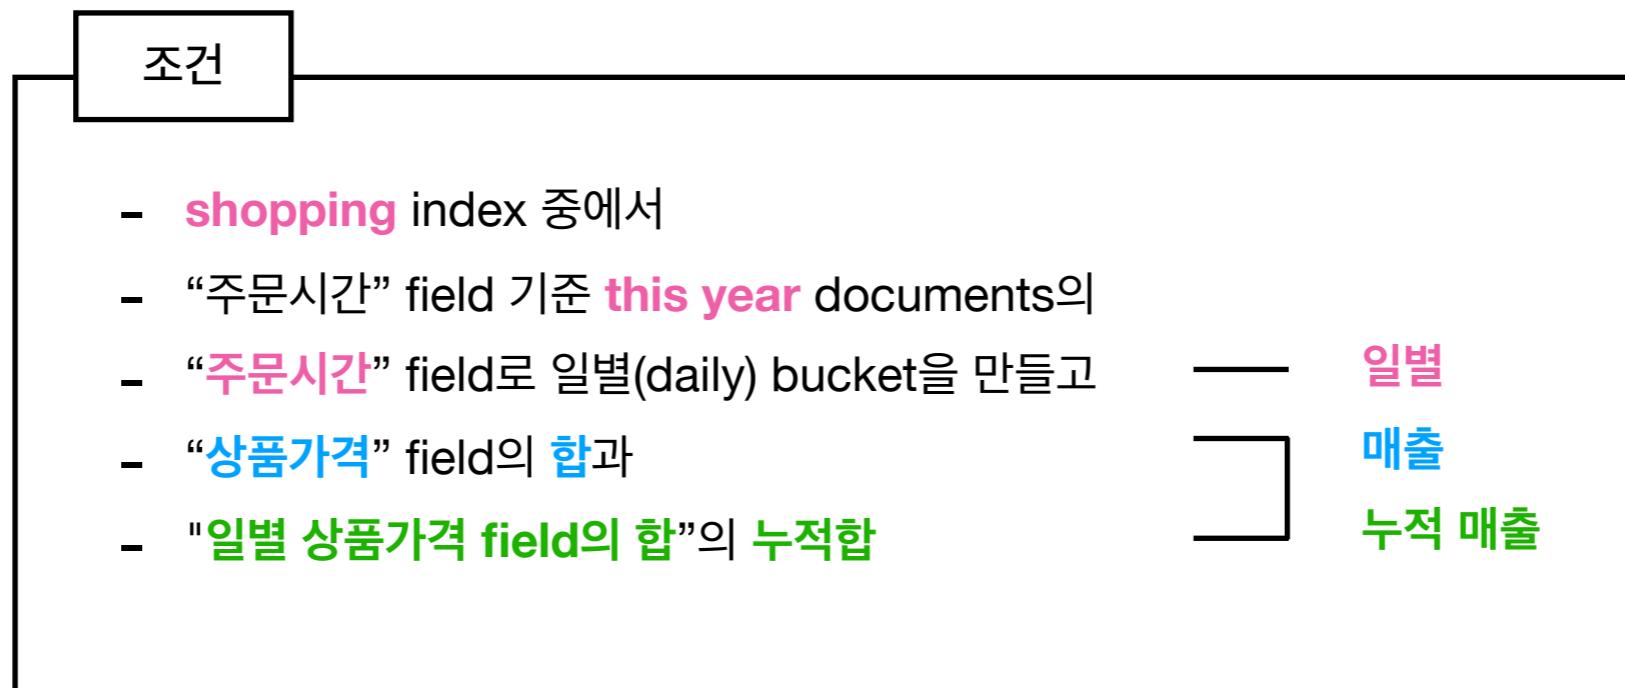

**Left Table (Daily Sales):**

날짜
2018-01-01
2018-01-02
2018-01-03
2018-01-04
2018-01-05
2018-01-06
2018-01-07
2018-01-08
2018-01-09
2018-01-10
2018-01-11

**Right Table (Cumulative Total Sales):**

매출	누적 매출
1,845,000	1,845,000
1,492,000	3,337,000
1,678,000	5,015,000
1,878,000	6,893,000
1,479,000	8,372,000
1,548,000	9,920,000
1,715,000	11,635,000
1,718,000	13,353,000
1,562,000	14,915,000
1,424,000	16,339,000
1,596,000	17,935,000

A green arrow points from the sum of the first two rows (1,845,000 + 1,492,000) to the third row's cumulative total (3,337,000).

## Data Table Configuration

The screenshot shows the configuration interface for a dataset named "shopping". The interface is divided into several sections:

- Metrics**:
  - Metric: Sum, Field: 상품가격, Custom Label: 매출
  - Metric: Cumulative Sum, Metric: metric: 매출, Custom Label: 누적 매출
- Aggregation**:
  - Date Histogram, Field: 주문시간, Interval: Daily, Custom Label: 날짜
- Buckets**:
  - Split Rows

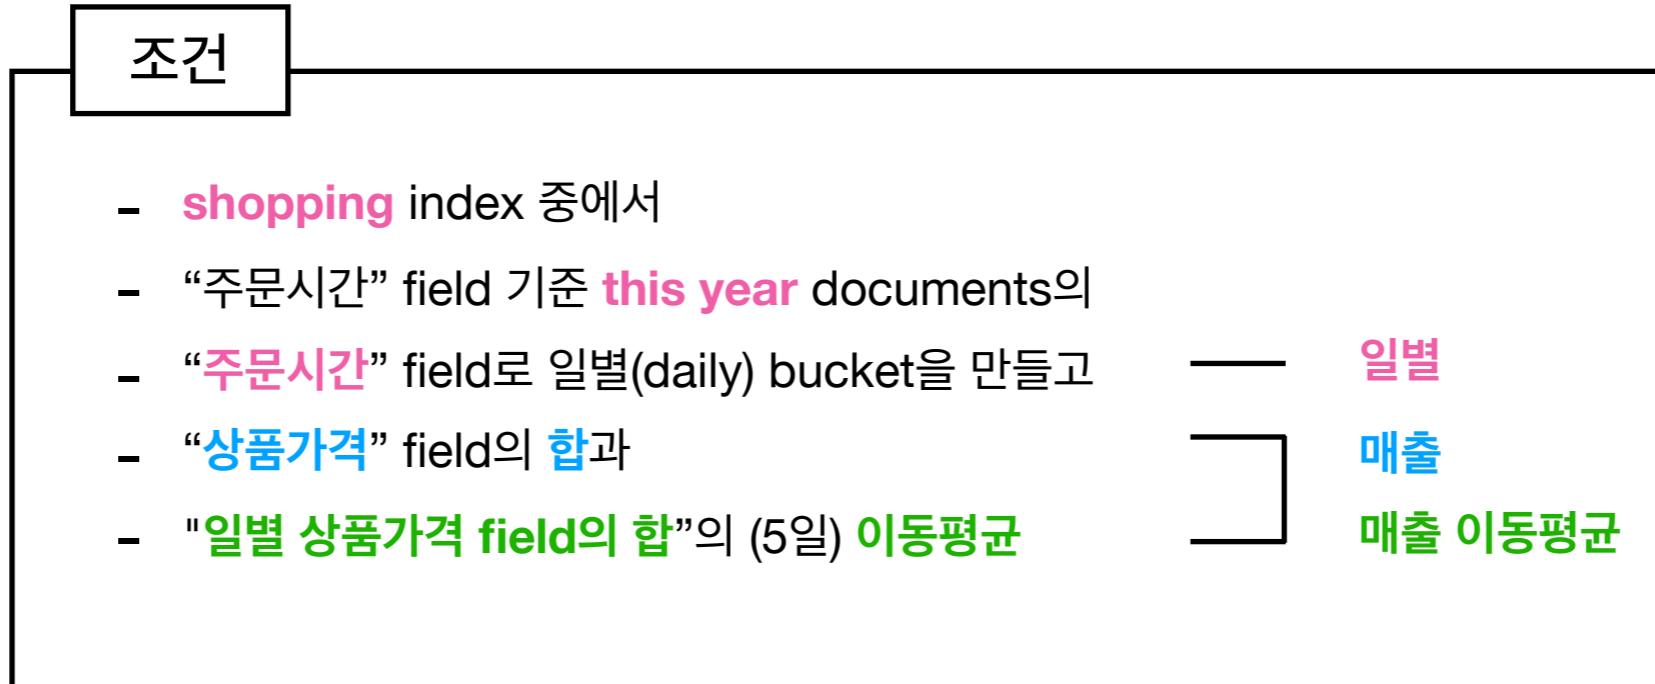

Dashed boxes highlight specific configurations:

- A blue dashed box surrounds the first metric configuration (Sum).
- A green dashed box surrounds the second metric configuration (Cumulative Sum).
- A pink dashed box surrounds the Date Histogram aggregation.

Blue arrows point from the green and pink boxes towards the blue box, indicating a relationship or dependency between the second metric and the Date Histogram aggregation.

**잠깐6, 이동평균의 window size를 변경하고 싶다면?**

The diagram illustrates the calculation of moving averages for daily sales data. It shows four columns: '날짜' (Date), '매출' (Sales), '매출 이동평균 (5일)' (5-day Moving Average), and '매출 이동평균 (3일)' (3-day Moving Average). A green box highlights the sales data for January 4, which is part of the 'window : 3' (3-day window) and 'window : 5' (5-day window). A blue box highlights the sales data for January 9, which is part of the 'window : 5'. Arrows indicate the sliding nature of the windows across the data.
